TEI Tite
A recommendation for off-site text encoding
Perry Trolard, for the TEI Consortium  Version 1.1 — September 2011
1 Introduction

TEI Tite is a constrained customization of TEI designed for use when outsourcing production of TEI documents to vendors, who use some combination of OCR and keyboarding to produce encoded text. While the canonical version of Tite is maintained by the TEI Council, a derived version is used in the AccessTEI program.

TEI Tite is meant to express a transitional format for documents, not an archival one. A project outsourcing encoding of documents using Tite should convert Tite documents created by vendors into a more suitable format for long-term preservation, such as one of the encoding levels of Best Practices for TEI in Libraries or a project-specific TEI customization.

While Tite includes only a limited set of all of the elements in TEI, it should not be confused with TEI Lite, which also contains a subset of elements. What distinguishes Tite from other TEI customizations is that Tite is meant to prescribe exactly one way of encoding a particular feature of a document in as many cases as possible, ensuring that any two encoders would produce the same XML document for a source document.

This document specifies how a source document should be encoded using TEI Tite. Its organizing model is roughly the structure of a TEI document itself, and it proceeds from high-level features to low, starting with general requirements, text structure, directions on when to group texts, considerations about type of text (genre and format), continuing down to instructions on marking phrase-level features, reference systems, and so forth. In its original ODD (one document does-it-all) format, this document can generate everything necessary for working in TEI Tite: both documentation (this Tite-specific prose as well as the full technical documentation for each of its elements) and schemas in either W3C Schema, RELAX NG, or XML DTD. Software utilities, including the Roma web tool, can generate these.

Tite uses a subset of the TEI’s elements, except for a few shortcut elements for the convenience of use by vendors (<b>, <i>, <ul>, <sup>, <sub>, <smcap>, <colShift/> and <ornament>) which can be transformed to normal TEI elements. Tite is also not a TEI-conformant customization since it breaks the TEI Abstract Model by omitting <teiHeader> for encoder convenience. That is, Tite was created primarily by removing elements and attributes from the TEI, and not from extensive modification. As a TEI customization, Tite inherits TEI semantics, and ambiguity in this specification should be resolved with reference to the TEI Guidelines. What makes Tite distinct is that where the TEI in general is famously tolerant of multiple methods of encoding a given feature, Tite seeks uniformity of encoding through constraint, via its stripped-down tag set and via this specification.

Tite can be used to encode printed prose, poetry, drama, newspapers, and anything else which can be described with the basic TEI building-blocks of divisions, paragraphs, line groups, and speeches.

In this documentation, document refers generally to the item (book, pamphlet, newspaper, etc.) to be encoded and text to either linguistic (as opposed to graphic) material or a logically distinct literary unit.

2 General Requirements

2.1 What to Capture

All printed material should be captured: all text (that is, printed characters) should be transcribed and the presence of graphical items or other non-transcribable elements should be indicated with markup.

2.2 End-of-line Hyphens

A distinction should be maintained in the electronic transcription between end-of-line or soft hyphens (an artifact of page layout) and hard hyphens (a linguistic feature). The former should be transcribed as the SOFT HYPHEN (U+00AD) character; the latter, as the HYPHEN-
MINUS (U+002D) character generally available on Western keyboards. In the rare case of coincidence of the two types — where a word that is normally hyphenated is split across a line break at its hyphen — the hyphen should be considered hard, and transcribed as the HYPHEN-MINUS.

2.3 Character Encoding
Characters should be encoded in UTF-8. For characters not easily input from the keyboard, use hexadecimal numeric entities (e.g. é, the small latin e with acute accent, is represented as &#x00E9;).

2.4 Accuracy and Verification
The standard for accuracy of transcription should be at least 99.99% (1 error in 10,000 characters). The sample size for verification will be 5% of the total text.

2.5 Documenting the Encoding Process
Almost surely, difficult encoding situations will arise whose resolution may not be covered by this documentation or the TEI Guidelines. In such cases, it is important to document the markup choices that are made. To this end each encoded file should be accompanied by a document with such notes. These notes should reference features of a document that seem remarkable to encoders and how these were handled by encoders.

3 Global Text Structure

3.1 TEI Tite text structure
In TEI Tite, <text> is the root element, containing front matter, the body of the text, and back matter.

```
<text xml:id="unique-identifier">
  <front>
  <!-- front matter -->
  </front>
  <body>
  <!-- body of text -->
  </body>
  <back>
  <!-- back matter -->
  </back>
</text>
```

The <text>’s xml:id attribute should contain a unique identifier for the document being encoded.

Tite omits the <teiHeader> element as a convenience to transcribers. This departs from normal TEI practice, which requires <TEI> as the root element, containing <teiHeader> and <text> elements. In order to bring a document encoded in TEI Tite into adherence with the TEI Abstract Model, projects should add a teiHeader before engaging in post-transcription processing.

3.2 Groups of Texts
A document should be encoded as a group of texts only when each member of the group contains its own front or back matter (most often, a separate title page). In this case the <group> element should be a child of the <text> element, and should contain child <text> elements each containing a <front>, <body>, and <back> (each <text> need not have both front and back matter, but should have at least one). Note that this group of texts will still
have its own front and back matter. When dealing with a group of texts, the basic TEI text
structure is modified to look like:

```xml
<text>
  <front>
  <!-- front matter for the group -->
  </front>
  <group>
    <text>
      <front>
      <!-- front matter of first text -->
      </front>
      <body>
      <!-- body of first text -->
      </body>
      <back>
      <!-- back matter of first text -->
      </back>
    </text>
    <text>
      <front>
      <!-- front matter of second text -->
      </front>
      <body>
      <!-- body of second text -->
      </body>
      <back>
      <!-- back matter of second text -->
      </back>
    </text>
  </group>
  <!-- more texts or groups of texts here -->
</text>
```

In cases where a document appears to contain a group of texts but the above condition is not
met, encode each unit as a (numbered) `<div>` with an appropriate `type` attribute.

### 3.3 Structural Divisions

Tite uses numbered divisions: `<div1>` through `<div7>`, which stand for levels of nesting within
a text. `<div1>`s nest inside or are contained by the `<front>`, `<body>`, and `<back>` elements,
 `<div2>`s nest inside or are contained by `<div1>`s, etc. The document’s table of contents is
often a good place to find cues about where structural divisions start and end; other cues can be
blank pages, recurring typographical or ornamental features, or a numbering system (“Chapter
5” etc.). Also, the presence of a heading will often indicate the beginning of a division.

The `type` attribute should be used to express the type of division being marked. Where
present, use a name for division type given in the document itself. Though any constrained
enumerated list of `type` values will have to be determined on a job-by-job basis, some examples
of appropriate division types are:

- act
- article
- book
- chapter
3 GLOBAL TEXT STRUCTURE

- essay
- letter
- part
- scene
- section
- subsection

When a heading is present, encode it with the `<head>` element. If there is more than one heading at the beginning of a given division, encode each heading with its own `<head>` element, using the `type` attribute to distinguish them. Appropriate values are:

- main
- sub (subtitle)
- alt (alternate)
- desc (descriptive)

The `n` attribute should be used to record sequential labels associated with a structural division (numbers, numerals, letters). When present, these labels should also be transcribed within the content of `<head>` element. For instance:

```xml
<div1 n="III" type="part">
  <head>III: It Awakes</head>
</div1>
```

3.3.1 False Indicators

A divisional title is a page that resembles a half-title page: it displays the title or heading of a major structural unit on an otherwise blank page. Divisional titles should be encoded not with a separate `<div>` element, but as a `<head>` within the appropriate `<div>` element. For half-title pages and similar fly-title pages see the section on Front Matter.

Another potential false indication of a new structural division is an ornament used as an informal division: a printer’s ornament of some sort, a string of asterisks or periods, or a horizontal line. Mark these with the special `<ornament>` element. If the ornament is a horizontal line or printer’s device or otherwise not transcribable, make the element empty and include an appropriate `type` attribute (line or ornament); if the ornament is made up of characters, transcribe the characters into the `<ornament>` element’s content.

3.4 Front and Back Matter

Front and back matter should be encoded with the `<front>` and `<back>` elements, respectively. `<div1>` elements should contain the major sections and should be characterized by `type` attribute values. The exception, however, is the title page, which should be encoded with the `<titlePage>` element and its children. The `<titlePart>` element should have a `type` attribute with one of the following values:

- main
- sub (subtitle)
- desc (descriptive title)
• alt (alternate title)
• volume (volume information)

<titlePart type="volume"/> should be used to encode volume information wherever it is found on the title page, even if it is separated from the other title information. The elements that make up the <titlePage> content model are: <graphic>, <byline>, <epigraph>, <docTitle>, <titlePart>, <docAuthor>, <docEdition>, <docImprint>, <docDate>, <figure>, <ornament>.

Information on the verso of the title page should be included as well (after a <pb/>).

Common items to encode in front and back matter — and therefore common type attribute values for <front> and <back> divisions are:

front
• acknowledgements
• advertisement
• castlist
• contents
• dedication
• fly-title
• foreword
• introduction
• preface

back
• appendix
• bibliography
• colophon
• glossary
• index

Half-title and fly-title pages may be encountered in the front matter. A half-title page precedes the title page proper and sometimes includes volume or series information; a fly-title page comes at the very end of the front matter, just before the body. In the case of half-titles, encode these as <div1 type="half-title"> (with <titlePart> elements as appropriate); in the case of fly-titles, encode them likewise with <div1 type="fly-title">, making sure to make the fly-title division the last part of the front matter (and not the first part of the body, as may seem reasonable as well).

4 Types of Text
Tite is equipped to support basic encoding of several types of text: in terms of genre, it supports prose, verse, and drama, and in terms of format, it supports books, newspapers, pamphlets, and other similar printed material. Tite has special elements for letters, verse, drama, and newspapers.
4.1 Letters

<opener> and <closer> are elements designed to encode the beginning and ending sections of letters, prefaces, diary entries, or other personal types of writing. Both elements contain:

- <dateline>: for recording time and place of composition; use <date> with when value (in W3C format as in the TEI Guidelines) to record date information
- <signed>: for recording a signature
- <salute>: for recording salutation at the beginning ("Dear Roger," ) or end ("Yours truly,"")

<opener> contains the additional elements <epigraph>, <argument>, and <byline>. 
<epigraph> will often be useful in the context of a letter. When encoding an epigraph, make sure to encode the content as you would any other feature, marking line groups, bibliographical elements, etc.

<argument> and <byline>, however, are not intended specifically for use with letters:

- <argument>: for a summary that precedes a division
- <byline>: for a statement of responsibility for the document

4.2 Verse

All verse should be encoded within at least one <lg> element, even when there are no distinct stanzas or when the verse is interspersed with prose. If it is known, use the type attribute to express the type of line group. Sometimes within a poem there is a question about what should be tagged as a <lg> or as a separate <div>. As a rough rule of thumb, if there is a title accompanying the division, use the <div> element; otherwise, use <lg>.

Each line of verse should be encoded with the <l> element, and care should be taken to distinguish these logical lines of verse from lines motivated by page layout. The latter should be encoded as <lb> s. Thus

AS virtuous men pass mildly away, And whisper to their souls to go, Whilst some of their sad friends do say, "Now his breath goes," and some say, "No."

should be encoded as

<lg type="stanza">
<l>AS virtuous men pass mildly away,</l>
<l rend="indent(1)">And whisper to their souls to go,</l>
<l>Whilst some of their sad friends do say,</l>
<l rend="indent(1)">"Now his breath goes," and some say, "No."
</lg>

Also, as in the example above, use the rend attribute to mark when a line is indented more than its siblings. Use numbered indent values (e.g. indent(1), indent(2), etc.) to make clear levels of indentation.

4.3 Drama

The standard TEI elements for drama should be used: <sp>, <stage>, <speaker>. If the who attribute is used on <sp>, also transcribe who is given as the speaker, in whatever form it is written, in the <speaker> element. Short pieces of stage direction that accompany the speaker designation may be included in the <speaker> element.

Scenes and acts should be encoded as appropriately nested <div> elements with type attributes of scene or act, respectively. Cast lists can likewise be encoded using <div> and type="castlist".

Prologues and epilogues can be treated as <sp> s of their own, unless their structure would be better represented by nested <div> elements.
4.4 Newspapers

Tite includes the elements `<colShift/>` and `<cb>` which are well suited for the multi-column layout of newspapers. Additional relevant elements are: `<ref>`, to encode a pointer to the continuation of a story in a different column or on a different page; and `<figure>`, to describe illustrations, advertisements, and cartoons.

5 Block-level Features

5.1 Block Quotations

Use the `<q>` element to encode block quotations. A block quotation is indicated by its being set off from surrounding text either with extra line-spacing or margins or with a different typeface. If the quotation is of an entire text, use the `<floatingText>` element and its children inside the `<q>` element:

```xml
<div type="intro">
    <p>...
    </p>
    <q>
        <floatingText>
            <body>
                <lg type="poem">
                    <!-- poem -->
                </lg>
            </body>
        </floatingText>
    </q>
    <p>...
    </p>
</div>
```

If present, transcribe all quotation marks or other delimiters inside the `<q>` element.

5.2 Figures

Use the `<figure>` element to encode figures. If a figure has a heading or caption, encode it with the `<head>` element. If there is associated text, simply use a `<p>` to encode it.

5.3 Tables and Lists

Tables and lists are encoded as in the TEI Guidelines, but note the following.

If a cell in a table is a heading or a label, set the `role` attribute to label; if the cell contains data, there is no need to use `role`: data is the default. If a cell or row spans more than one column or row, use the `rows` or `cols` attributes set to the number of columns or rows that it spans.

If unsure about whether a structure is best encoded as a list or table, record it as a table only if it would not be properly understood without tabular layout.

Lists should be encoded as either sequences of `<items>` or `<label>`-`<item>` pairs. When items in the list contain a label, as in a gloss list, be sure to use the latter form.

5.4 Notes

Both the reference to the note in the running text and the note itself must be encoded. Use `<ptr>` or `<ref>` to encode the reference. If there is no reference in the text (often the case for marginal notes), supply a `<ptr>` element in a reasonable place in the text running beside the note. If there is a reference (number, symbol, etc.), use the `<ref>` element and include the
reference text as the content. In both cases, a \textit{target} attribute must be supplied which contains the \textit{xml:id} value of the associated \textit{<note>}

When encoding the note itself with the \textit{<note>} element, the \textit{xml:id} and \textit{place} attributes must be supplied. See the TEI documentation for acceptable values for \textit{place}; the most common will be foot, end, margin-left (-right, -top, -bot).

Transcribe the note directly after it is referenced in the document. In the case of notes without explicit reference (pointed to with \textit{<ptr>}), set the \textit{anchored} attribute to false.

5.5 divWrapper Elements

Elements that can appear at the beginning and end of structural divisions, such as \textit{<argument>}, \textit{<epigraph>}, and \textit{<opener>}, are called divWrapper elements in the TEI class system. An \textit{argument} is a summary of what is to come; be sure to distinguish this from a \textit{heading}, which is a \textit{title} for the division. If an epigraph comes with bibliographic or simple citation material, encode this as well. For example:

\begin{verbatim}
<epigraph>
  <cit>
    <q>"I have sworn upon the altar of God eternal hostility against every form of tyranny over the mind of man."
  </q>
  <bibl>
    <author>Thomas Jefferson.</author>
  </bibl>
</cit>
</epigraph>
\end{verbatim}

5.6 Uncertain Blocks

In rare cases where the logical identity of a block-level element is hard to discern, use the TEI element \textit{<ab>} (anonymous block) instead of applying a \textit{<p>} or \textit{<div>} element. In these cases, be sure to document this decision in accompanying notes. \textit{Applying this element should be viewed as a last resort.}

The \textit{<gap>} element should be used when for some reason the document being transcribed contains illegible text (smudged, torn, missing, etc.) or something outside the scope of transcription for a given project: characters in an unsupported character set, for instance. \textit{<gap>} indicates that something is omitted. When using \textit{<gap>}, set the \textit{reason} attribute to an appropriate value. (See \textit{<unclear>} below.)

6 Phrase-level Features

6.1 Typographical Changes

There are six elements in Tite that capture specific typographical features:

- for bold-face glyphs
- for italicized glyphs
- for underlined glyphs
- for glyphs in small-caps
- for glyphs in subscript
- for glyphs in superscript
These mark the physical change, and are agnostic about a logical motivation for it. There are two exceptions to this approach, however: marking foreign words and titles. In the case of foreign words, use the `<foreign>` element; in the case of titles, use the `<title>` element only if certain that the word or phrase in question is a title. If a phrase is, say, italicized, but you are uncertain about its being a title, use the `<i>` element instead. Foreign words should be marked only if they are typographically distinguished from surrounding text.

In addition, the `<handshift>` element may be used within the body of a transcription to indicate where a change of hand is detected for whatever reason.

If there is a typographical feature not covered by the above elements, the TEI `<hi>` element is still available in Tite. Use it without a `rend` attribute.

6.2 Phrase-level Quotation
For passages set off by quotation marks or another delimeter, use the `<q>` element, including the delimeter inside the tag.

6.3 Alignment and Indentation
If the alignment of an element seems remarkable, set the element’s `rend` attribute to an appropriate value (normally center, right, left, etc.). However, when semantic already accounts for its cause, description of alignment is not necessary. Headings, for instance, do not need to be marked as being centered.

To indicate level of indentation (often in verse), use numerical arguments to indent, as in `indent(1)`, `indent(-1)`, and so on.

6.4 Uncertain Segments
The `<seg>` element is the phrase-level analogue to the `<ab>` element. If a phrase-level feature seems to be present but its identity is hard to fathom, use this element. This, again, is a last resort.

Alternately, when a passage of text is for some reason too hard to read, use the `<unclear>` element, setting the `reason` attribute to an appropriate value. When using `<unclear>`, surround the entire word with the tag if any part of it is unclear (not just the illegible letter, say).

6.5 Unknown Glyphs
For cases in which it is unknown which character a given glyph corresponds to, mark the glyph with the `<g>` element to indicate the uncertainty. By convention in Tite, `<g>` represents any unknown glyph: no `ref` attribute is necessary. Note that unknown glyphs are different from illegible text.

7 Reference Systems
Encode page breaks `<pb>` at the start of each page, and encode breaks even for blank pages. If the page is numbered, include the page number as the value of the `n` attribute and, again, no matter where the page number is printed on the page, place the `<pb>` element at the top.

If marking column breaks, follow the same rules as for page breaks. Column breaks are imagined to appear at the top of the column, at the beginning of the column’s text. The `<colShift/>` element exists to record a change in columnar layout. If such a change occurs, mark the beginning of the new layout with `<colShift/>` and supply the new number of columns as the value for the `n` attribute.

For many applications, it will not be important to capture line breaks in ordinary prose text, but in cases where they are purposeful (such as the layout of acrostics, or where a word is broken across a line), they should be captured using the `<lb>` element, placing it at the start of each line.
7 REFERENCE SYSTEMS

A  TEI Tite and the Best Practices for TEI in Libraries

The Best Practices for TEI in Libraries ("BP") creates common definitions of levels of encoding based on depth of markup applied. Because the levels of encoding provide a tremendously useful common set of terms, it’s helpful to situate TEI Tite according to them.

Mapped to BP levels, TEI Tite would sit between Level 3 and Level 4: it requires use of all the elements from Level 3 plus additional ones, but requires fewer elements than Level 4. Relative to Level 3, Simple Analysis, Tite

- encourages the use of the rend attribute on typographically distinct text (marked with <hi>), implicitly, through the provision of convenience elements (<i>, <b>, etc.), and it provides the <title> and <foreign> elements for semantic markup of typographically distinct phrases; in level 3, the rend attribute is optional, and <title> and <foreign> are not provided
- provides some genre-specific elements in addition to those for verse that level three also provides (<lg>, <l>): <sp>, <speaker>, and <stage> for drama, the <colShift/> element especially for newspapers.

The most useful comparison for Tite is to Level 4 (Basic Content Analysis), provides the most useful comparison. The following items represent instances where Tite is less ambitious than Level 4:

- except in the case of the <foreign> and <title> elements, it is preferred in Tite to describe typographical changes physically, rather than semantically; Tite uses <i>, <b>, etc. where level four uses <emph>, <gloss>, <term>
- Tite provides only <q> for quoted material, where level four is more discriminating, using <quote>, <said>, <mentioned>, <soCalled>
- Tite doesn’t provide elements for editorial intervention, as level four does: <choice>, <sic>, <corr>
- Tite doesn’t provide entity-specific naming elements, like <persName>, <placeName>, <orgName> and their list- <listPerson>, etc.) forms

Bringing Tite-encoded documents up to BP Level 4 would simply require application of additional markup, not significant reworking of markup, and in that way Tite is compatible with the BP.

Do also keep in mind that Tite lacks both the <teiHeader> and root <TEI> element used in TEI-conformant documents.

B  Formal specification

B.1 Elements

<ab> (anonymous block) contains any arbitrary component-level unit of text, acting as an anonymous container for phrase or inter level elements analogous to, but without the semantic baggage of, a paragraph. [16.3. Blocks, Segments, and Anchors]
May contain:

- `<abbr>` (abbreviation) contains an abbreviation of any sort. [[3.5.5. Abbreviations and Their Expansions]]

### Module core

#### Attributes

- `att.global (@xml:id, @n, @xml:lang, @xml:space)`
- `att.global.rendition (@rend, @style)`
- `att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)`
- `att.global.facs (@facs)`

---

```xml
<abbr>
(abbreviation) contains an abbreviation of any sort. [3.5.5. Abbreviations and Their Expansions]
```

```xml
<content>
<macroRef key="macro.paraContent"/>
</content>
```
The `<abbr>` tag is not required; if appropriate, the encoder may transcribe abbreviations in the source text silently, without tagging them. If abbreviations are not transcribed directly but expanded silently, then the TEI header should so indicate.

**Example**

```xml
<choice>
  <expan>North Atlantic Treaty Organization</expan>
  <abbr cert="low">NorATO</abbr>
  <abbr cert="high">NATO</abbr>
  <abbr cert="high" xml:lang="fr">OTAN</abbr>
</choice>
```

**Example**

```xml
<choice>
  <abbr>SPQR</abbr>
  <expan>senatus populusque romanorum</expan>
</choice>
```

**Content model**

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

**Schema Declaration**

```xml
element abbr { att.global.attributes, macro.phraseSeq }
```
**<add>** (addition) contains letters, words, or phrases inserted in the source text by an author, scribe, or a previous annotator or corrector. [3.4.3. Additions, Deletions, and Omissions]

**Module core**

**Attributes Attributes**

```
att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style))
  (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))
  (att.global.facs (@facs))

list listBibl milestone name note num pb ptr q ref stage time title unclear
derived-module-tei_tite: b colShift i ornament smcap sub sup ul
figures: figure formula table
```

**Note** In a diplomatic edition attempting to represent an original source, the `<add>` element should not be used for additions to the current TEI electronic edition made by editors or encoders. In these cases, either the `<corr>` or `<supplied>` element are recommended.

In a TEI edition of a historical text with previous editorial emendations in which such additions or reconstructions are considered part of the source text, the use of `<add>` may be appropriate, dependent on the editorial philosophy of the project.

**Example**

The story I am going to relate is true as to its main facts, and as to the consequences of these facts from which this tale takes its title.

**Content model**

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

<content>
<macroRef key="macro.phraseSeq"/>
</content>
```

```
<element addrLine { att.global.attributes, macro.phraseSeq }
```

**<address>** contains a postal address, for example of a publisher, an organization, or an individual. [5.2.2. Addresses 2.2.4. Publication, Distribution, Licensing, etc. 3.11.2.4. Imprint, Size of a Document, and Reprint Information]

**Module core**

**Attributes**

```
atts.global (@xml:id, @n, @xml:lang, @xml:space)
(atts.global.rendition (@rend, @style))
(atts.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))
(atts.global.facs (@facs))
(atts.global.change (@change))
(atts.global.responsibility (@cert, @resp))
(atts.global.source (@source))
```

**Member of** model.addressLike

**Contained by**

```
core: abbr add addrLine author bibl date del desc editor email foreign head hi item label name note num p
pubPlace publisher ref resp speaker stage time title unclear

derived-module-tei_tite: bi smcap sub sup ul

derived-module-tei_tite: colShift
derived-module-tei_tite: figure

derived-module-tei_tite: colShift
```

**May contain**

```
core: addrLine cb gap lb milestone name note ph
```

**Note** This element should be used for postal addresses only. Within it, the generic element `<addrLine>` may be used as an alternative to any of the more specialized elements available from the model.addrPart class, such as `<street>`, `<postCode>` etc.

**Example** Using just the elements defined by the core module, an address could be represented as follows:

```
<address>
  <street>via Marsala 24</street>
  <postCode>40126</postCode>
  <name>Bologna</name>
  <name>Italy</name>
</address>
```

**Example** When a schema includes the names and dates module more specific elements such as country or settlement would be preferable over generic `<name>`:

```
<address>
  <street>via Marsala 24</street>
  <postCode>40126</postCode>
  <settlement>Bologna</settlement>
</address>
```
<country>Italy</country>
</address>

Example

<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL 60680</addrLine>
  <addrLine>USA</addrLine>
</address>

Example

<address>
  <country key="FR"/>
  <settlement type="city">Lyon</settlement>
  <postCode>69002</postCode>
  <district type="arrondissement">IIème</district>
  <district type="quartier">Perrache</district>
  <street>
    <num>30</num>, Cours de Verdun</street>
</address>

Content model

}

<author> in a bibliographic reference, contains the name(s) of an author, personal or corporate, of a work; for example in the same form as that provided by a recognized bibliographic name authority. 3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement

Module core
Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch,
Note Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes key or ref may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as Unknown or Anonymous. When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

Example

<author>British Broadcasting Corporation</author>
<author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634–1693)</author>
<author>Anonymous</author>
<author>Bill and Melinda Gates Foundation</author>
<author>
  <persName>Beaumont, Francis</persName> and
  <persName>John Fletcher</persName>
</author>
<orgName key="BBC">British Broadcasting Corporation</orgName>: Radio 3 Network

May contain Empty element
Note On this element, the global n attribute indicates the number or other value associated with the column which follows the point of insertion of this <cb> element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page. The <cb> element is placed at the head of the column to which it refers.

Example Markup of an early English dictionary printed in two columns:

```xml
<pb/>
<cb n="1"/>
<entryFree>
<form>Well</form>, <sense>a Pit to hold Spring-Water</sense>:
<sense>In the Art of <hi rend="italic">War</hi>, a Depth the Miner sinks into the Ground, to find out and disappoint the Enemies Mines, or to prepare one</sense>.
</entryFree>
<entryFree>To <form>Welter</form>, <sense>to wallow</sense>, or <sense>lie groveling</sense>.</entryFree>
</cb>
<cb n="2"/>
<entryFree>
<form>Wey</form>, <sense>the greatest Measure for dry Things, containing five Chaldron</sense>.
</entryFree>
<entryFree>
<form>Whale</form>, <sense>the greatest of Sea-Fishes</sense>.
</entryFree>
```

Content model `<content>`</content>"
character data

Example

```xml
<row>
  <cell role="label">General conduct</cell>
  <cell role="data">Not satisfactory, on account of his great unpunctuality and inattention to duties</cell>
</row>
```

Content model

```xml
<content>
  <macroRef key="macro.specialPara"/>
</content>
```

Schema Declaration

```xml
element cell
  {
    att.global.attributes,
    att.tableDecoration.attributes,
    macro.specialPara
  }
```

<cit> (cited quotation) contains a quotation from some other document, together with a bibliographic reference to its source. In a dictionary it may contain an example text with at least one occurrence of the word form, used in the sense being described, or a translation of the headword, or an example. [3.3.3. Quotation 4.3.1. Grouped Texts 9.3.5.1. Examples]

derived-module-tei_tite: b i smcap sub sup ul
gaiji:
figures: figure formula table
gaiji:  

Note This element should be used for deletion of shorter sequences of text, typically single words or phrases. The <delSpan> element should be used for longer sequences of...
text, for those containing structural subdivisions, and for those containing
overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able
to transcribe it (unless it is restored in a `<supplied>` tag). Illegible or lost text
within a deletion may be marked using the `<gap>` tag to signal that text is present
but has not been transcribed, or is no longer visible. Attributes on the `<gap>`
element may be used to indicate how much text is omitted, the reason for omitting
it, etc. If text is not fully legible, the `<unclear>` element (available when using the
additional tagset for transcription of primary sources) should be used to signal the
areas of text which cannot be read with confidence in a similar way.

Degrees of uncertainty over what can still be read, or whether a deletion was
intended may be indicated by use of the `<certainty>` element (see 21. Certainty,
Precision, and Responsibility).

There is a clear distinction in the TEI between `<del>` and `<surplus>` on the one
hand and `<gap>` or `<unclear>` on the other. `<del>` indicates a deletion present in
the source being transcribed, which states the author’s or a later scribe’s intent to
cancel or remove text. `<surplus>` indicates material present in the source being
transcribed which should have been so deleted, but which is not in fact. `<gap>` or
 `<unclear>`, by contrast, signal an editor’s or encoder’s decision to omit something or
their inability to read the source text. See sections 11.3.1.7. Text Omitted from or
Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and
supplied Elements in Combination for the relationship between these and other
related elements used in detailed transcription.

**Example**

```xml
<l>
  <del rend="overtyped">Mein</del> Frisch
  <del rend="overstrike" type="primary">schwebt</del>
  <del rend="overstrike" type="primary">weht der Wind
</l>
```

**Example**

```xml
<del rend="overstrike">
  <gap reason="illegible" quantity="5"
       unit="character"/>
</del>
```

**Content model**

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

**Schema Declaration**

```xml
element del
{
  att.global.attributes,
  att.transcriptional.attributes,
  atttyped.attributes,
  macro.paraContent}
```
<desc> (description) contains a brief description of the object documented by its parent element, typically a documentation element or an entity. [22.4.1. Description of Components]

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend, @style)) (att.global/linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global/facs (@facs)) (att.global/change (@change)) (att.global/responsibility (@cert, @resp)) (att.global/source (@source)) att.typed (@type)

Chapter VI.
Fruit and vegetable soups

Stocks for all kinds of soups

Rich strong stock

Medium Stock

Apple soup

Ingredients

2 lbs. of good boiling apples,
3/4 teaspoonful of white pepper,
6 cloves,
cayenne or ginger to taste,
3 quarts of medium stock

Mode

Peel and quarter the apples taking out their cores; put them into the stock, stew them gently till tender, Rub the whole through a strainer, add the seasoning. give it one boil up, and serve.

Time

1 hour.

Average cost

per quart, 1s.

Seasonable

from September to December.

Sufficient

for 10 persons

The apple

This useful fruit is mentioned in Holy Writ; and Homer describes it as valuable in his time... As a food, the apple cannot be considered to rank high, as more than the half of it consists of water, and the rest of its properties are not the most nourishing. It is however a useful adjunct to other kinds of food, and, when cooked, is esteemed as slightly laxative.

51
Note any sequence of low-level structural elements, e.g., paragraphs (\texttt{<p>}), lists (\texttt{<list>}), or examples (\texttt{<eg> or <egXML>}).

\textbf{Example}

\begin{verbatim}
<altRecipe>
  <head>Asparagus soup</head>
  <div5 type="recipe">
    <head>Stocks for all kinds of soups</head>
    <div6 type="altRecipe">
      <head>I.</head>
      <div7>
        <head>Ingredients</head>
        <list>
          …
        </list>
      </div7>
      <div7>
        <head>Mode</head>
        <p>Put the beef, cut into pieces and rolled in flour, into a stewpan…</p>
      </div7>
    </div6>
    <div6 type="altRecipe">
      <head>II.</head>
      <div7>
        <head>Ingredients</head>
        <list>
          …
        </list>
      </div7>
      <div7>
        <head>Mode</head>
        <p>Boil the peas, and rub them through a sieve; add the gravy…</p>
      </div7>
    </div6>
  </altRecipe>
</div2>
\end{verbatim}

\textbf{Content model}

\begin{verbatim}
<content>
  <sequence>
    <alternate minOccurs="0" maxOccurs="unbounded">
      <classRef key="model.divTop"/>
      <classRef key="model.global"/>
    </alternate>
    <sequence minOccurs="0" maxOccurs="1" maxOccurs="unbounded">
    </sequence>
  </sequence>
</content>
\end{verbatim}
Schema Declaration

```xml
<element div7>
  {
    att.global.attributes,
    att.typed.attributes,
      {
        ( model.divTop | model.global )*,
        ( ( model.common, model.global* )+, ( model.divBottom, model.global* )* )?
      }
  }
</element>
```

(document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline).

- transcr: handShift
- character data

Note The document author’s name often occurs within a byline, but the `<docAuthor>` element may be used whether the `<byline>` element is used or not. It should be
used only for the author(s) of the entire document, not for author(s) of any subset or part of it. (Attributions of authorship of a subset or part of the document, for example of a chapter in a textbook or an article in a newspaper, may be encoded with `<byline>` without `<docAuthor>`.)

Example

```xml
<titlePage>
  <docTitle>
    <titlePart>Travels into Several Remote Nations of the World, in Four Parts.</titlePart>
  </docTitle>
  <byline> By <docAuthor>Lemuel Gulliver</docAuthor>, First a Surgeon, and then a Captain of several Ships</byline>
</titlePage>
```

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element docAuthor { att.global.attributes, macro.phraseSeq }
```

 `<docDate>` (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
  (att.global.change (@change)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source))
@when gives the value of the date in standard form, i.e. YYYY-MM-DD.

Status Optional

Datatype teidata,temporal.w3c

Note For simple dates, the when attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in XML Schema Part 2: Datatypes Second Edition.

Member of model.divWrapper model.pLike.front model.titlepagePart

Contained by core: lg list

figures: figure table
textstructure: back body dateline div1 div2 div3 div4 div5 div6 div7 docImprint front
group titlePage

May contain core: abbr add address cb date del email foreign gap graphic hi lb milestone name note num pb ptr ref time title unclear
derived-module-tei_tite: b colShift i smcap sub sup ul

figures: figure formula
Note  Cf. the general <date> element in the core tag set. This specialized element is provided for convenience in marking and processing the date of the documents, since it is likely to require specialized handling for many applications. It should be used only for the date of the entire document, not for any subset or part of it.

Example

<docImprint>Oxford, Clarendon Press, <docDate>1987</docDate></docImprint>

Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

figures: figure formula table
gaiji:  ע
linking:  ס
textstructure: floatingText
transcr:  handShift

character data
B  FORMAL SPECIFICATION

Note  Cf. the <edition> element of bibliographic citation. As usual, the shorter name has been given to the more frequent element.

Example

Content model

<content>
<macroRef key="macro.paraContent"/>
</content>

Schema Declaration

```
element docEdition { att.global.attributes, macro.paraContent }  
```

<docImprint>  (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page.  

Module texstructure

Attributes  att.global (@xml:id, @n, @xml:lang, @xml:space)

( att.global.rendition (@rend, @style))

( att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select))

( att.global.facs (@facs))

( att.global.change (@change))

( att.global.responsibility (@cert, @resp))

( att.global.source (@source))

Member of model.pLike.front  model.titlePagePart

Contained by texstructure:       back     front     titlePage

May contain

core: abbr add address cb date del email foreign gap graphic hi lb milestone name note num pb ptr pubPlace publisher ref time title unclear

derived-module-tei_tite:  b colShift i smcap sub sup ul

figures: figure formula

gaiji: g

linking: seg

textstructure:  docDate
transcr: handShift

character data

Note  Cf. the <imprint> element of bibliographic citations. As with title, author, and editions, the shorter name is reserved for the element likely to be used more often.

Example

Imprints may be somewhat more complex:

<docImprint>
   <pubPlace>London</pubPlace>
   Printed for <name>E. Nutt</name>,

56
at
<pubPlace>Royal Exchange</pubPlace>;
<name>J. Roberts</name> in
<pubPlace>wick-Lane</pubPlace>;
<name>A. Dodd</name> without
<pubPlace>Temple-Bar</pubPlace>;
and <name>J. Graves</name> in
<pubPlace>St. James's-street.</pubPlace>
<date>1722.</date>
</docImprint>

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>

```
<figure>
  <head>The View from the Bridge</head>
  <figDesc>A Whistleresque view showing four or five sailing boats in the foreground, and a series of buoys strung out between them.</figDesc>
  <graphic url="http://www.example.org/fig1.png" scale="0.5"/>
</figure>
```

**Content model**

```
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
</alternate>
</content>
```
<altref key="model.headLike"/>
<altref key="model.common"/>
<elelref key="figDesc"/>
<altref key="model.graphicLike"/>
<altref key="model.global"/>
<altref key="model.divBottom"/>
</alternate>
</content>

---

**Schema Declaration**

```xml
<element figure
{
  att.global.attributes,
  att.typed.attributes,
  {
    model.headLike | model.common | figDesc | model.graphicLike | model.global | model.divBottom
  }
}
```

---

**<floatingText>** contains a single text of any kind, whether unitary or composite, which interrupts the text containing it at any point and after which the surrounding text resumes. [4.3.2. Floating Texts]

**Module** textstructure

**Attributes**

- `att.global` (`@xml:id, @n, @xml:lang, @xml:space)`
- `att.global.rendition (@rend, @style)`
- `att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)`
- `att.global.facs (@facs)`
- `att.global.change (@change)`
- `att.global.responsibility (@cert, @resp)`
- `att.global.source (@source)`

**Member of** model.qLike

character data

\textbf{Note} The global \texttt{xml:lang} attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in \S1. Language Identification.

This element is intended for use only where no other element is available to mark the phrase or words concerned. The global \texttt{xml:lang} attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

The \texttt{<distinct>} element may be used to identify phrases belonging to sublanguages or registers not generally regarded as true languages.

\textbf{Example}

This is heathen Greek to you still? Your \texttt{<foreign xml:lang="la">lapis philosophicus</foreign>}?

  <epigraph>
    <quote>Nam Sibyllam quidem Cumis ego ipse oculis meis vidi in ampulla
                pendere, et cum illi pueri dicerent: <q xml:lang="gr">Σίβυλλα τί
                θέλεις</q>; respondebat illa: <q xml:lang="gr">ἀποθανεῖν θέλω.</q>
  </quote>
  </epigraph>
  <p>For Ezra Pound <q xml:lang="it">il miglior fabbro.</q>
</p>
</front>
```

**Note** Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the `<front>` and `<back>` elements are identical.
Example

BACKGROUND:
Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.

OBJECTIVE:
We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.

DESIGN:
Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical measurements, as body mass index (calculated as kg/m2) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.

RESULTS:
Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.

CONCLUSIONS:
Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate food-insecurity measures in children.

Note The <gap>, <unclear>, and <del> core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was deliberately erased or covered, should be indicated using the relevant tags, such as <del> in the case of deliberate deletion.

Example

<gap quantity="4" unit="chars" reason="illegible"/>
<graphic>

Example

```xml
<gap quantity="1" unit="essay"
      reason="sampling"/>
```

Example

```xml
<del>
  <gap atLeast="4" atMost="8" unit="chars"

transcr: handShift

character data

Note The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div> is the title of that chapter or section.

Example The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example:
<div n="I" type="book">
  <head>In the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
  <div type="section">
    <head>In the name of Christ here begins Book I of the history.</head>
    <p>Proposing as I do ...</p>
    <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p>
    <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer>
  </div>
</div>

Example When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the place attribute.

<div type="subsection">
  <head place="margin">Secunda conclusio</head>
  <p>
    <lb n="1251"/>
    <hi rend="large">Potencia: habitus: et actus: recipiunt speciem ab objectis</hi>
  </p>
  <lb n="1252"/>Probatur sic. Omne importans necessarium habitudinem ad proprium [...]
</div>

Example The head element is also used to mark headings of other units, such as lists:

With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted">
  <head>Connectives</head>
  <item>above</item>
  <item>accordingly</item>
  <item>across from</item>
  <item>adjacent to</item>
  <item>again</item>
</list>

Note

May contain simple prose or a sequence of chunks.

Whatever string of characters is used to label a list item in the copy text may be used as the value of the global n attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the n attribute on the <item> element is by definition synonymous with the use of the <label> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <label> element, not n.

Example

<list rend="numbered">
  <head>Here begin the chapter headings of Book IV</head>
  <item n="4.1">The death of Queen Clotild.</item>
  <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item>
  <item n="4.3">The wives and children of Lothar.</item>
  <item n="4.4">The Counts of the Bretons.</item>
  <item n="4.5">Saint Gall the Bishop.</item>
  <item n="4.6">The priest Cato.</item>
  <item> ...</item>
</list>

  ( text | model.qLike | model.phrase | model.inter | model.global )*
</label>

<list type="gloss" xml:lang="enm">
  <head xml:lang="en">Vocabulary</head>
  <headLabel xml:lang="en">Middle English</headLabel>
  <headItem xml:lang="en">New English</headItem>
  <label xml:lang="en">nu</label>
  <item xml:lang="en">now</item>
  <label xml:lang="en">lhude</label>
  <item xml:lang="en">loudly</item>
  <label xml:lang="en">bloweth</label>
  <item xml:lang="en">blooms</item>
  <label xml:lang="en">med</label>
  <item xml:lang="en">meadow</item>
  <label xml:lang="en">wude</label>
  <item xml:lang="en">wood</item>
  <label xml:lang="en">awe</label>
  <item xml:lang="en">ewe</item>
  <label xml:lang="en">lhouth</label>
  <item xml:lang="en">lows</item>
</list>

Example: Labels are commonly used for the headwords in glossary lists; note the use of the global xml:lang attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:
<label>sterteth</label>
<item xml:lang="en">bounds, frisks (cf. <cit><ref>Chaucer, K.T.644</ref><quote>a courser, <term>sterting</term>as the fyr</quote></cit></item>
<label>verteth</label>
<item xml:lang="la">pedit</item>
<label>murie</label>
<item xml:lang="en">merrily</item>
<label>swik</label>
<item xml:lang="en">cease</item>
<label>naver</label>
<item xml:lang="en">never</item>
</list>

Example Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon’s Autobiography. In this usage the <label> element is synonymous with the n attribute on the <item> element:

I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos.
<list rend="runon" type="ordered">
<label>(1)</label>
<item>My first rough manuscript, without any intermediate copy, has been sent to the press.</item>
<label>(2)</label>
<item>Not a sheet has been seen by any human eyes, excepting those of the author and the printer: the faults and the merits are exclusively my own.</item>
</list>

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

<list type="gloss">
<label>March 1757.</label>
<item>I wrote some critical observations upon Plautus.</item>
<label>March 8th.</label>
<item>I wrote a long dissertation upon some lines of Virgil.</item>
<label>June.</label>
<item>I saw Mademoiselle Curchod — <quote>Omnia vincit amor, et nos cedamus amori.</quote></item>
<label>August.</label>
<item>I went to Crassy, and staid two days.</item>
</list>

Note that the <label> might also appear within the <item> rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

Example Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the <label> element appears within the <p> or <lg> element, rather than as a preceding sibling of it.

<p>[...]</p>
<lb>& n’entrer en mauvais & mal-heu-</lb>
<lb>ré meſnage. Or des que le confente-</lb>
<lb>ment des parties y eft le mariage eft
arresté, quoy que de faict il ne foit Puiffance maritale entre les Romains.

conformé. Depuis la conforma-
destion du mariage la femme eft fous
la puiffance du mary, s’il n’eſt efcla-
ue ou enfant de famille : car en ce
cas, la femme, qui a eſpouſé vn en-
fant de famille, eſt ſous la puiffance

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the type attribute may be used to distinguish different categories of label.

May contain Empty element
```
Note By convention, `<lb>` elements should appear at the point in the text where a new line starts. The `n` attribute, if used, indicates the number or other value associated with the text between this point and the next `<lb>` element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the `<l>` element is available) except in circumstances where structural units cannot otherwise be marked.

The `type` attribute may be used to characterize the line break in any respect. The more specialized attributes `break`, `ed`, or `edRef` should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```xml
<l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</l>
<l>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe,</l>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The `break` attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```xml
<titlePart>
<lb/>With Additions, ne.<lb break="no"/>ver before Printed.
</titlePart>
```

Content model `<content></content>`

```

@type describes the nature of the items in the list.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: gloss each list item glosses some term or concept, which is given by a `<label>` element preceding the list item.

index each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.

instructions each list item is a step in a sequence of instructions, as in a recipe.

litany each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.

syllogism each list item is part of an argument consisting of two or more propositions and a final conclusion derived from them.

Note Previous versions of these Guidelines recommended the use of type on `<list>` to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the rend or style attributes for these aspects of a list, while using type for the more appropriate task of characterizing the nature of the content of a list.

Note The formal syntax of the element declarations allows `<label>` tags to be omitted from lists tagged `<list type="gloss">`; this is however a semantic error.
Example

<list rend="numbered">
  <item>a butcher</item>
  <item>a baker</item>
  <item>a candlestick maker, with</item>
  <list rend="bulleted">
    <item>rings on his fingers</item>
    <item>bells on his toes</item>
  </list>
</list>

Example

<list type="syllogism" rend="bulleted">
  <item>All Cretans are liars.</item>
  <item>Epimenides is a Cretan.</item>
  <item>ERGO Epimenides is a liar.</item>
</list>

Example

<list type="litany" rend="simple">
  <item>God save us from drought.</item>
  <item>God save us from pestilence.</item>
  <item>God save us from wickedness in high places.</item>
  <item>Praise be to God.</item>
</list>

Example

The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

<div1 type="section">
  <head>Athelstan's Ordinance</head>
  <list rend="numbered">
    <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with
    the stolen goods, [if he is] over twelve years and [if the value of the goods is] over
    eightpence.
    <list rend="numbered">
      <item n="1.1">And if anyone does spare one, he is to pay for the thief with his
      wergild — and the thief is to be no nearer a settlement on that account — or to
clear himself by an oath of that amount.</item>

<item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].</item>

<item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.</item>

<item n="1.4">And if he steals after that, they are to pay for him with his wergild, or to bring him back there.</item>

<item n="1.5">And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.</item>
</list>

<item n="2">Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting.

<list rend="numbered">
<item n="2.1">And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief.</item>
<item n="2.2">And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.</item>
</list>

<item n="3">Concerning the refusal of justice. The lord who refuses justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice.

<list rend="numbered">
<item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion; if he does it more often, he is to be liable to pay all that he owns.</item>
<item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to the same.</item>
</list>

<item n="4">Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot
deny it or is afterwards convicted at the three-fold ordeal.

Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.

Example

<p>These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.</p>

<div>

<list rend="simple">
  <item>Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.</item>
  <item>Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.</item>
  <item>Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.</item>
  <item>Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.</item>
  <item>Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.</item>
  <item>Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.</item>
  <item>Æthelwine, bishop, have subscribed through delegates.</item>
  <item>Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.</item>
</list>

<p></p>

May contain Empty element

Note For this element, the global n attribute indicates the new number or other value for 
the unit which changes at this milestone. The special value unnumbered should be 
used in passages which fall outside the normal numbering scheme, such as chapter or 
other headings, poem numbers or titles, etc.

The order in which <milestone> elements are given at a given point is not normally 
significant.

Example

<milestone n="23" ed="La" unit="Dreissiger"/>
... <-milestone n="24" ed="AV" unit="verse"/> ...
Content model `<content></content>`

Schema Declaration

```
element milestone
{
    att.global.attributes,
    att.milestoneUnit.attributes,
    att.typed.attributes,
    empty
}
```

*(name, proper noun) contains a proper noun or noun phrase.*

character data

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

```
94
```
And yet it is not only in the great line of Italian renaissance art, but even in the painterly <note place="bottom" type="gloss" resp="#MDMH"> Malerisch</note>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as <mentioned>picturesque</mentioned> and <mentioned>painterly</mentioned> respectively. 
</note> style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global n attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

Mevorakh b. Saadya's mother, the matriarch of the family during the second half of the eleventh century, <note n="126" anchored="true"> The alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact, a reference to Judah's children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents published by Jacob Mann.

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

\texttt{att.global.facs} (@facs)
\texttt{att.global.change} (@change)
\texttt{att.global.responsibility} (@cert, @resp)
\texttt{att.global.source} (@source)

\texttt{@type} indicates the type of numeric value.

Status Optional

Datatype \texttt{teidata.enumerated}

Suggested values include:

- \textbf{cardinal} absolute number, e.g. 21, 21.5
- \textbf{ordinal} ordinal number, e.g. 21st
- \textbf{fraction} fraction, e.g. one half or three-quarters
- \textbf{percentage} a percentage

Note If a different typology is desired, other values can be used for this attribute.

textstructure: argument back body byline closer dateline div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle epigraph floatingText front group opener postscript salute signed text titlePage titlePart trailer

May contain Empty element

Note A &lt;pb&gt; element should appear at the start of the page which it identifies. The

global n attribute indicates the number or other value associated with this page.

This will normally be the page number or signature printed on it, since the physical

sequence number is implicit in the presence of the &lt;pb&gt; element itself.

The type attribute may be used to characterize the page break in any respect. The

more specialized attributes break, ed, or edRef should be preferred when the intent is

to indicate whether or not the page break is word-breaking, or to note the source

from which it derives.

Example Page numbers may vary in different editions of a text.

&lt;p&gt; ... &lt;pb n="145" ed="ed2"/&gt;
&lt;!-- Page 145 in edition "ed2" starts here --&gt; ... &lt;pb n="283" ed="ed1"/&gt;
&lt;!-- Page 283 in edition "ed1" starts here--&gt; ... &lt;/p&gt;

Example A page break may be associated with a facsimile image of the page it introduces

by means of the facs attribute
<div type="letter">
  <opener>
    <dateline>
      <<placeName>Rimaone</placeName>
      <date when="2006-11-21">21 Nov 06</date>
    </dateline>
    <salute>Dear Susan,</salute>
    </opener>
    <p>Thank you very much for the assistance splitting those logs. I'm sorry about the misunderstanding as to the size of the task. I really was not asking for help, only to borrow the
axe. Hope you had fun in any case.</p>

(quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

3.3.3. Quotation

Module core

Attributes

att.global ( @xml:id, @n, @xml:lang, @xml:space)

( att.global.rendition ( @rend, @style ) )

( att.global.linking ( @corresp, @synchr, @sameAs, @copyOf, @next, @prev, @exclude, @select ) )

( att.global.facs ( @facs ) )

( att.global.change ( @change ) )

( att.global.responsibility ( @cert, @resp ) )

( att.global.source ( @source ) )

@type may be used to indicate whether the offset passage is spoken or thought, or to characterize it more finely.

Status  Optional

Datatype  teidata.enumerated

Suggested values include: spoken  representation of speech

  thought  representation of thought, e.g. internal monologue

written  quotation from a written source

soCalled  authorial distance

foreign

distinct  linguistically distinct

term  technical term

emph  rhetorically emphasized

mentioned  referring to itself, not its normal referent

Member of  model.qLike

Contained by

core:  add cit del desc head hi item l note p q ref sp stage title unclear

Note The attribute ref, inherited from the class att.canonical may be used to indicate the
kind of responsibility in a normalized form by referring directly to a standardized list
of responsibility types, such as that maintained by a naming authority, for example
the list maintained at

http://www.loc.gov/marc/relators/relacode.html for bibliographic
usage.

Example

<respStmt>
  <resp ref="http://id.loc.gov/vocabulary/relators/com.html">compiler</resp>
  <name>Edward Child</name>
</respStmt>

Content model

<content>
  <macroRef key="macro.phraseSeq.limited"/>
</content>

Schema Declaration

element resp
{   att.global.attributes,
    att.datable.attributes,
    macro.phraseSeq.limited}

<respStmt> (statement of responsibility) supplies a statement of responsibility for the
intellectual content of a text, edition, recording, or series, where the specialized
elements for authors, editors, etc. do not suffice or do not apply. May also be used to
encode information about individuals or organizations which have played a role in
the production or distribution of a bibliographic work.
Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)

(att.global rendition (@rend, @style)) (att.global linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global facs (@facs))

(att.global change (@change)) (att.global responsibility (@cert, @resp))

(att.global source (@source))

Member of model.respLike

Contained by

core: bibl

May contain

core: name note resp

Example

<respStmt>
  <resp>transcribed from original ms</resp>
  <persName>Claus Huitfeldt</persName>
</respStmt>

Example

<respStmt>
  <resp>converted to XML encoding</resp>
  <name>Alan Morrison</name>
</respStmt>

Content model

<content>
  <sequence>
    <alternate>
      <sequence>
        <elementRef key="resp" minOccurs="1" maxOccurs="unbounded"/>
        <classRef key="model.nameLike.agent" minOccurs="1" maxOccurs="unbounded"/>
      </sequence>
    </alternate>
    <sequence>
      <classRef key="model.nameLike.agent" minOccurs="1" maxOccurs="unbounded"/>
      <elementRef key="resp" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <elementRef key="note" minOccurs="0" maxOccurs="unbounded"/>
  </sequence>
</content>

Schema Declaration

element respStmt
{
  att.global attributes,
  {
    ( ( resp+, model.nameLike.agent+ ) | ( model.nameLike.agent+, resp+ ) ),
    note
  }
}
contains one row of a table.

**Module** figures

Attributes

- `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@xml:space`)
- `att.global.rendition` (`@rend`, `@style`)
- `att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`)
- `att.global.facs` (`@facs`)

derived-module-tei_tite:  b colShift i ornament smcap sub sup ul

figures:  figure formula table

gaiji:  g

linking:  seg
Note The <seg> element may be used at the encoder’s discretion to mark any segments of
the text of interest for processing. One use of the element is to mark text features
for which no appropriate markup is otherwise defined. Another use is to provide an
identifier for some segment which is to be pointed at by some other element—i.e. to
provide a target, or a part of a target, for a <ptr> or other similar element.

Example

<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>

Example

<s>
  <seg rend="caps" type="initial-cap">So father’s only</seg> glory was the
  ballfield.
</s>

Example

  att.typed (@type)
  att.written (@hand)
```

Contained by

textstructure: group

May contain

core: cb gap lb milestone note pb
derived-module-tei_tite: colShift
figures: figure
textstructure: back body front group

Note This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the `<floatingText>` is provided for this purpose.

Example

```
<text>
  <front>
    <docTitle>
      <titlePart>Autumn Haze</titlePart>
    </docTitle>
  </front>
  <body>
    <l>Is it a dragonfly or a maple leaf?</l>
    <l>That settles softly down upon the water?</l>
  </body>
</text>
```

Example The body of a text may be replaced by a group of nested texts, as in the following schematic:

```
<text>
  <front>
    <!-- front matter for the whole group -->
  </front>
  <group>
    <text>
      <!-- first text -->
    </text>
    <text>
      <!-- second text -->
    </text>
  </group>

\]

\text{<title>} contains a title for any kind of work. \text{3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.5. The Series Statement}
Note This attribute is provided for convenience in analysing titles and processing them according to their type: where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single `<title>` element.

@level indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

Status Optional

Datatype `teidata.enumerated`

Legal values are:
- `a` (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.
- `m` (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works
- `j` (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper
- `s` (series) the title applies to a series of otherwise distinct publications such as a collection
- `u` (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

Note The level of a title is sometimes implied by its context: for example, a title appearing directly within an `<analytic>` element is *ipso facto* of level `a`, and one appearing within a `<series>` element of level `s`. For this reason, the `level` attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.
Note The attributes key and ref, inherited from the class att.canonical may be used to indicate the canonical form for the title; the former, by supplying (for example) the identifier of a record in some external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

Example

```xml
```

Example

```xml
<title>Hardy's Tess of the D'Urbervilles: a machine readable edition</title>
```

Example

```xml
<title type="full"></title>
<title type="main">Synthèse</title>
<title type="sub">an international journal for epistemology, methodology and history of science</title>
</title>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```
<element title {
  att.global.attributes,
  att.datable.attributes,
  attribute type { text }?,
  attribute level { "a" | "m" | "j" | "s" | "u" }?,
  macro.paraContent}
```

```
<content> (title page) contains the title page of a text, appearing within the front or back matter. [4.6. Title Pages]
```

Module textstructure

Attributes

```
att.global ( @xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition ( @rend, @style)) (att.global.linking ( @corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs ( @facs))
  (att.global.change ( @change)) (att.global.responsibility ( @cert, @resp))
(att.global.source ( @source))
```

@type classifies the title page according to any convenient typology.

Status Optional

Datatype teidata.enumerated

Note This attribute allows the same element to be used for volume title pages, series title pages, etc., as well as for the main title page of a work.
**Example**

```xml
<titlePage>
<docTitle>
  <titlePart type="main">THOMAS OF Reading.</titlePart>
  <titlePart type="alt">OR, The sixe worthy yeomen of the West.</titlePart>
</docTitle>
<docEdition>Now the fourth time corrected and enlarged</docEdition>
<byline>By T.D.</byline>
<figure>
  <head>TP</head>
  <p>Thou shalt labor till thou returne to duste</p>
  <figDesc>Printers Ornament used by TP</figDesc>
</figure>
<docImprint>Printed at <name type="place">London</name> for <name>T.P.</name> 1612.</docImprint>
</titlePage>
```

**Content model**

```xml
<content>
  <sequence>
    <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    <classRef key="model.titlepagePart"/>
    <alternate minOccurs="0" maxOccurs="unbounded">
      <classRef key="model.titlepagePart"/>
      <classRef key="model.global"/>
    </alternate>
  </sequence>
</content>
```

**Schema Declaration**

```xml
element titlePage {
  att.global.attributes,
  attribute type { text }?,
  (model.global*,
   model.titlepagePart,
   (model.titlepagePart | model.global)*)
}
```
<titlePart> contains a subsection or division of the title of a work, as indicated on a title page. [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
  (att.global.change (@change)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source))

@type specifies the role of this subdivision of the title.

Status Optional

Datatype teidata.enumerated

Suggested values include: main main title of the work[Default]
sub (subordinate) subtitle of the work
alt (alternate) alternative title of the work
short abbreviated form of title
desc (descriptive) descriptive paraphrase of the work

Character data

Content model `<content/>`

Schema Declaration
contains a word, phrase, or passage which cannot be transcribed with
certainty because it is illegible or inaudible in the source. [11.3.3.1. Damage,
Illegibility, and Supplied Text 3.4.3. Additions, Deletions, and Omissions]

Module core
Attributes Attributes att.global ( @xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition ( @rend, @style)) (att.global.linking ( @corresp, @synch,
@sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs ( @facs))
(att.global.change ( @change)) (att.global.responsibility ( @cert, @resp))
(att.global.source ( @source))

@reason indicates why the material is hard to transcribe.

Status Optional
Datatype 1–∞ occurrences of teidata.word separated by whitespace

<head>Rx</head>
<p>500 mg <unclear reason="illegible">placebo</unclear></p>

Note One or more words may be used to describe the reason;
usually each word will refer to a single cause. Typical
examples might thus include faded, illegible,
ecentric_ductus background_noise, passing_truck, etc.

character data

Note The same element is used for all cases of uncertainty in the transcription of element
content, whether for written or spoken material. For other aspects of certainty,
uncertainty, and reliability of tagging and transcription, see chapter 21. Certainty,
Precision, and Responsibility.
The `<damage>`, `<gap>`, `<del>`, `<unclear>` and `<supplied>` elements may be closely allied in use. See section 11.3.3. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The hand attribute points to a definition of the hand concerned, as further discussed in section 11.3.2.1. Document Hands.

Example

```xml
<u>...and then <unclear reason="background-noise">Nathalie</unclear> said ...
</u>
```

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element unclear
{
  att.global.attributes,
  attribute reason { list { + } }?,
  macro.paraContent}
```

B.2 Model classes

**model.addrPart** groups elements such as names or postal codes which may appear as part of a postal address. [3.5.2. Addresses]

**Module** tei

**Used by** address

**Members** model.nameLike, model.nameLike.agent, name, model.offsetLike, model.placeStateLike, model.placeNamePart] addrLine

Members author editor respStmt
**model.segLike** groups elements used for arbitrary segmentation. [16.3. Blocks, Segments, and Anchors] [17.1. Linguistic Segment Categories]

*Module* tei

*Used by* bibl, model.phrase

*Members* seg

*Note* The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the `<segmentation>` element of the `<encodingDesc>` within the associated TEI header.

---

**model.stageLike** groups elements containing stage directions or similar things defined by the module for performance texts. [7.3. Other Types of Performance Text]

*Module* tei

*Used by* lg, model.inter, sp

*Members* stage

*Note* Stage directions are members of class *inter*: that is, they can appear between or within component-level elements.

---

**model.titlepagePart** groups elements which can occur as direct constituents of a title page, such as `<docTitle>`, `<docAuthor>`, `<docImprint>`, or `<epigraph>`. [4.6. Title Pages]

*Module* tei

*Used by* titlePage

*Members* argument, byline, docAuthor, docDate, docEdition, docImprint, docTitle, epigraph, graphic, ornament, titlePart

**B.3 Attribute classes**

---

**att.datable** provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times] [13.3.6. Dates and Times]

*Module* tei

*Members* name, resp, title

*Attributes* Attributes att.datable.w3c (@when, @from, @to)

*calendar* indicates the system or calendar to which the date represented by the content of this element belongs.

*Status* Optional

*Datatype* teidata_pointer

*Schematron* <sch:rule context="tei:*[@calendar]"> <sch:assert test="string-length(.) gt 0">@calendar indicates the system or calendar to which the date represented by the content of this element belongs, but this `<sch:name/>` element has no textual content.</sch:assert> </sch:rule>

He was born on `<date calendar="#gregorian">Feb. 22, 1732</date>` ( `<date calendar="#julian" when="1732-02-22"> Feb. 11, 1731/32, O.S.</date>` ).
Note Note that the calendar attribute (unlike datingMethod defined in att.datable.custom) defines the calendar system of the date in the original material defined by the parent element, not the calendar to which the date is normalized.

This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.datable.iso and att.datable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.datable.w3c provides attributes for normalization of elements that contain datable events conforming to the W3C XML Schema Part 2: Datatypes Second Edition. [3.5.4. Dates and Times|13.3.6. Dates and Times]

Module tei
Members att.datable[name resp title]
Attributes Attributes
@when supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.
Status Optional
Datatype teidata.temporal.w3c
Examples of W3C date, time, and date & time formats. <p>
<date when="1945-10-24">24 Oct 45</date>
<date when="1996-09-24T07:25:00Z">September 24th, 1996 at 3:25 in the morning</date>
<date when="1999-01-04T20:42:00-05:00">Jan 4 1999 at 8 pm</date>
<time when="14:12:38">fourteen twelve and 38 seconds</time>
<date when="1962-10">October of 1962</date>
<date when="06-12">June 12th</date>
<date when="08">the first of the month</date>
<date when="08">August</date>
<date when="MMVI">AD 56</date>
<date when="-0056">56 BC</date>
</p>
This list begins in the year 1632, more precisely on Trinity Sunday, i.e. the Sunday after Pentecost, in that year the
<date calendar="#julian" when="1632-06-06">27th of May (old style)</date>.
<opener>
<dateline>
<placeName>Dorchester, Village</placeName>
<date when="1828-03-02">March 2d. 1828.</date>
</dateline>
<salute>To Mrs. Cornell,</salute> Sunday
<time when="12:00:00">noon</time>
</opener>

@from indicates the starting point of the period in standard form, e.g. yyyy-mm-dd.
att.declarable

Status Optional
Datatype teidata.temporal.w3c

@to indicates the ending point of the period in standard form, e.g. yyyy-mm-dd. 
Status Optional 
Datatype teidata.temporal.w3c

Schematron <sch:rule context="tei:*[@when]"> 
  <sch:report test="@notBefore|@notAfter|@from|@to" role="nonfatal">The @when attribute cannot be used with any other att.datable.w3c attributes.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@from]"> <sch:report test="@notBefore" role="nonfatal">The @from and @notBefore attributes cannot be used together.</sch:report> </sch:rule>

Schematron <sch:rule context="tei:*[@to]"> <sch:report test="@notAfter" role="nonfatal">The @to and @notAfter attributes cannot be used together.</sch:report> </sch:rule>

Example

<date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date>

Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, --mm, ---dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.

Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

att.declarable provides attributes for those elements in the TEI header which may be independently selected by means of the special purpose decls attribute. [15.3. Associating Contextual Information with a Text]

Module tei

Members bibl listBibl
Attributes Attributes

@default indicates whether or not this element is selected by default when its parent is selected.
Status Optional
Datatype teidata.truthValue

Legal values are: true This element is selected if its parent is selected 
false This element can only be selected explicitly, unless it is the only one of its kind, in which case it is selected if its parent is selected.[Default]

The rules governing the association of declarable elements with individual parts of a TEI text are fully defined in chapter 15.3. Associating Contextual Information with a Text. Only one element of a particular type may have a default attribute with a value of true.
att.docStatus provides attributes for use on metadata elements describing the status of a document.

Module tei
Members bibl
Attributes Attributes

@status describes the status of a document either currently or, when associated with a dated element, at the time indicated.

Status Optional
Datatype teidata.enumerated

Sample values include: approved, candidate, cleared, deprecated, draft [Default], embargoed, expired, frozen, galley, proposed, published, recommendation, submitted, unfinished, withdrawn.

Example

```xml
<revisionDesc status="published">
  <change when="2010-10-21" status="published"/>
  <change when="2010-10-02" status="cleared"/>
  <change when="2010-08-02" status="embargoed"/>
  <change when="2010-05-01" status="frozen" who="#MSM"/>
  <change when="2010-03-01" status="draft" who="#LB"/>
</revisionDesc>
```

att.fragmentable provides an attribute for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module tei
Members p
Attributes Attributes

@part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

Status Optional
Datatype leidata.enumerated

Legal values are: Y (yes) the element is fragmented in some (unspecified) respect
N (no) the element is not fragmented, or no claim is made as to its completeness [Default]
I (initial) this is the initial part of a fragmented element
M (medial) this is a medial part of a fragmented element
F (final) this is the final part of a fragmented element

Note The values I, M, or F should be used only where it is clear how the element may be reconstituted.

att.global provides attributes common to all elements in the TEI encoding scheme.

[1.3.1.1. Global Attributes]

Module tei

Members abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi i item label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes Attributes att.global.rendition (@rend, @style) att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select) att.global.facs (@facs) att.global.change (@change) att.global.responsibility (@cert, @resp) att.global.source (@source)

@xml:id (identifier) provides a unique identifier for the element bearing the attribute.

Status Optional
Datatype ID

Note The xml:id attribute may be used to specify a canonical reference for an element; see section 3.10. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.

Status Optional
Datatype leidata.text

Note The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.

Status Optional
Datatype leidata.language

<p>... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">ariki</foreign> or chief</p>
(Routledge 1920:205,210) and their connections to ancestral territorial organization.

**Note** The xml:lang value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify xml:lang at the highest appropriate level, noticing that a different default may be needed for the teiHeader from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.

The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see http://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php.

The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <language> element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@xml:space signals an intention about how white space should be managed by applications.

**Status** Optional

**Datatype** teidata.enumerated

**Legal values are:**
- default signals that the application’s default white-space processing modes are acceptable
- preserve indicates the intent that applications preserve all white space

**Note** The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

**att.global.change** supplies the change attribute, allowing its member elements to specify one or more states or revision campaigns with which they are associated.

**Module** transcr

**Members** att, global, abbr, address, argument, author, b, back, bibl, body, byline, cb, cell, closer, colShift, date, dateline, del, div, desc, divl, div2, div3, div4, div5, div6, div7, docAuthor, docDate, docEdition, docImprint, docTitle, editor, email, epigraph, figure, floatingText, foreign, formula, front, gap, graphic, group, handShift, head, hi, item, label, li, l, list, listBibl, milestone, name, note, num, opener, ornament, p, pb, postscript, ptr, pubPlace, publisher, q, ref, resp, respStmt, row, salute, seg, signed, smcap, sp, speaker, stage, sub, sup, table, text, time, title, titlePage, titlePart, trailer, ul, unclear

**Attributes**

@change points to one or more <change> elements documenting a state or revision campaign to which the element bearing this attribute and its children have been assigned by the encoder.

**Status** Optional
att.global.facs provides an attribute used to express correspondence between an element containing transcribed text and all or part of an image representing that text. [11.1. Digital Facsimiles]

Module transcr

Members att.global abbr add addrLine address argument author b back bibl body byline ch cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item l label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes Attributes

@facs (facsimile) points to all or part of an image which corresponds with the content of the element.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

att.global.linking provides a set of attributes for hypertextual linking. [16. Linking, Segmentation, and Alignment]

Module linking

Members att.global abbr add addrLine address argument author b back bibl body byline ch cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item l label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes Attributes

@corresp (corresponds) points to elements that correspond to the current element in some way.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

<text xml:id="t1-g1-t1" xml:lang="mi">
  <body xml:id="t1-g1-t1-body1">
    <div type="chapter">
      <head>He Whakamaramatanga mo te Ture Hoko, Riihi hoki, nga Whenua Maori, 1876.</head>
      <p>…</p>
    </div>
  </body>
</text>

<text xml:id="t1-g1-t2" xml:lang="en">
  <body xml:id="t1-g1-t2-body1">
    corresp="#t1-g1-t1-body1"<div type="chapter">
"…"</body>
</text>
An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.
att.global.rendition

att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.1.3. Rendition Indicators]

Module tei

Members att.global abbr add addrLine address argument author b back bibl body byline ch cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item lb lg list ListBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes

@rend (rendition) indicates how the element in question was rendered or presented in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.word separated by whitespace

<head rend="align(center) case(allcaps)">

<lb>To The <lb>Duchesse <lb>of <lb>Newcastle,

<lb>On Her <lb>

<hi rend="case(mixed)">New Blazing-World</hi>.

</head>

Note These Guidelines make no binding recommendations for the values of the rend attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially
useful conventions are noted from time to time at appropriate points in the Guidelines. The values of the \texttt{rend} attribute are a set of sequence-indeterminate individual tokens separated by whitespace.

\texttt{@style} contains an expression in some formal style definition language which defines the rendering or presentation used for this element in the source text.

\textit{Status Optional}

\textit{Datatype} \texttt{teidata.text}

```xml
<head style="text-align: center; font-variant: small-caps">
  <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her <lb/>
  <hi style="font-variant: normal">New Blazing-World</hi>.
</head>
```

\textit{Note} Unlike the attribute values of \texttt{rend}, which uses whitespace as a separator, the \texttt{style} attribute may contain whitespace. This attribute is intended for recording inline stylistic information concerning the source, not any particular output. The formal language in which values for this attribute are expressed may be specified using the \texttt{<styleDefDecl>} element in the TEI header.

If \texttt{style} and \texttt{rendition} are both present on an element, then \texttt{style} overrides or complements \texttt{rendition}. \texttt{style} should not be used in conjunction with \texttt{rend}, because the latter does not employ a formal style definition language.

\texttt{att.global.responsibility} provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it. \texttt{[1.3.1.1.4. Sources, certainty, and responsibility \[3.4. Simple Editorial Changes \[11.3.2.2. Hand, Responsibility, and Certainty Attributes \[17.3. Spans and Interpretations \[13.1.1. Linking Names and Their Referents\]

\textit{Module} tei

\textit{Members} \texttt{att.global.abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item i label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref respStmt row salute seg signed smcap sp speaker stage sub sup sup text time title titlePage titlePart trailer ul unclear}

\textit{Attributes} \texttt{Attributes}

\texttt{@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.}

\textit{Status Optional}

\textit{Datatype} \texttt{teidata.probCert}

\texttt{@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.}

\textit{Status Optional}

\textit{Datatype} \texttt{1–∞ occurrences of teidata.pointer separated by whitespace}

\textit{Note} To reduce the ambiguity of a \texttt{resp} pointing directly to a person or organization, we recommend that \texttt{resp} be used to point not to an agent \texttt{(<person> or <org>)} but to a \texttt{<respStmt>}, \texttt{<author>},
att.global.source provides an attribute used by elements to point to an external source. [1.3.1.4. Sources, certainty, and responsibility] 3.3.3. Quotation [8.3.4. Writing]

Module tei

Members att.global abbr addr addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item1 label li lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace published q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes

@source specifies the source from which some aspect of this element is drawn.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note The source attribute points to an external source. When used on elements describing schema components such as <schemaSpec> or <moduleRef> it identifies the source from which declarations for the components of the object being defined may be obtained.

On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI,
for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a `<prefixDef>`.

If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.

**Example**

```xml
<p>
  <!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>)
tells us, <quote source="#mcc_2012">'Collaboration’ is a problematic and should be a contested term.</quote>
  <!-- ... -->
</p>
```

**Example**

```xml
<p>
  <!-- ... -->
  <quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote>
  <!-- ... -->
</p>
```

```xml
<bibl xml:id="chicago_15_ed">
  <title level="m">The Chicago Manual of Style</title>,
</bibl>
```

**Example**

```xml
<elementRef key="p" source="tei:2.0.1"/>
```

Include in the schema an element named `<p>` available from the TEI P5 2.0.1 release.

**Example**

```xml
<schemaSpec ident="myODD"
  source="mycompiledODD.xml">
  <!-- further declarations specifying the components required -->
</schemaSpec>
```

Create a schema using components taken from the file `mycompiledODD.xml`.

---

**att.milestoneUnit** provides an attribute to indicate the type of section which is changing at a specific milestone. [3.10.3. Milestone Elements] [2.3.6.3. Milestone Method] [2.3.6. The Reference System Declaration]

**Module** core

**Members** milestone

**Attributes** Attributes
@unit provides a conventional name for the kind of section changing at this milestone.

Status Required
Datatype teidata.enumerated

Suggested values include: page physical page breaks (synonymous with the <pb> element).

column column breaks.
line line breaks (synonymous with the <lb> element).
book any units termed book, liber, etc.
poem individual poems in a collection.
canto cantos or other major sections of a poem.
speaker changes of speaker or narrator.
stanza stanzas within a poem, book, or canto.
act acts within a play.
scene scenes within a play or act.
section sections of any kind.
absent passages not present in the reference edition.
unnumbered passages present in the text, but not to be included as part of the reference.

Note If the milestone marks the beginning of a piece of text not present in the reference edition, the special value absent may be used as the value of unit. The normal interpretation is that the reference edition does not contain the text which follows, until the next <milestone> tag for the edition in question is encountered.

In addition to the values suggested, other terms may be appropriate (e.g. Stephanus for the Stephanus numbers in Plato).

att.personal (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]

Module tei
Members name
Attributes Attributes
@full indicates whether the name component is given in full, as an abbreviation or simply as an initial.

Status Optional
Datatype teidata.enumerated

Legal values are: yes the name component is spelled out in full.[Default]

abb (abbreviated) the name component is given in an abbreviated form.
**init** (initial letter) the name component is indicated only by one
initial.

@sort specifies the sort order of the name component in relation to others within
the name.

**Status** Optional

**Datatype** `teidata.count`

---

**att.pointing** provides a set of attributes used by all elements which point to other
elements by means of one or more URI references. [1.3.1.1.2. Language Indicators
3.6. Simple Links and Cross-References]

**Module** tei

**Members** note ptr ref

**Attributes** Attributes

@targetLang specifies the language of the content to be found at the destination
referred to by target, using a language tag generated according to BCP 47.

**Status** Optional

**Datatype** `teidata.language`

**Schematron**

```xml
<sch:rule context="tei::*[not(self::tei:schemaSpec)][@targetLang]">  
    <sch:assert test="@target">@targetLang should only be used on
    <sch:name/> if @target is specified.</sch:assert>  
</sch:rule>
```

```xml
<linkGrp xml:id="pol-swh_aln_2.1-linkGrp">
    <ptr xml:id="pol-swh_aln_2.1.1-ptr"
        target="pol/UDHR/text.xml#pol_txt_1-head"
        type="tuv"
        targetLang="pl"/>
    <ptr xml:id="pol-swh_aln_2.1.2-ptr"
        target="swh/UDHR/text.xml#swh_txt_1-head"
        type="tuv"
        targetLang="sw"/>
</linkGrp>
```

In the example above, the `<linkGrp>` combines
pointers at parallel fragments of the *Universal Declaration
of Human Rights*: one of them is in Polish, the other in
Swahili.

**Note** The value must conform to BCP 47. If the value is a private
use code (i.e., starts with x- or contains -x-), a
`<language>` element with a matching value for its `ident`
attribute should be supplied in the TEI header to document
this value. Such documentation may also optionally be
supplied for non-private-use codes, though these must remain
consistent with their (IETF) Internet Engineering Task
Force definitions.

@target specifies the destination of the reference by supplying one or more URI
References

**Status** Optional

**Datatype** 1–∞ occurrences of `teidata.pointer` separated by whitespace

**Note** One or more syntactically valid URI references, separated by
whitespace. Because whitespace is used to separate URIs, no
whitespace is permitted inside a single URI. If a whitespace
character is required in a URI, it should be escaped with the normal
mechanism, e.g. TEI%20Consortium.
**att.resourced** provides attributes by which a resource (such as an externally held media file) may be located.

*Module* tei

*Members* graphic

*Attributes* Attributes

@url (uniform resource locator) specifies the URL from which the media concerned may be obtained.

*Status* Required

*Datatype* teidata.pointer

---

**att.sortable** provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. [[9.1 Dictionary Body and Overall Structure]]

*Module* tei

*Members* bibl item list listBibl

*Attributes* Attributes

@sortKey supplies the sort key for this element in an index, list or group which contains it.

*Status* Optional

*Datatype* teidata.word

David’s other principal backer, Josiah ha-Kohen <index indexName="NAMES">

<term sortKey="Azarya_Josiah_Kohen">Josiah ha-Kohen b. Azarya</term>

</index> b. Azarya, son of one of the last gaons of Sura was David’s own first cousin.

*Note* The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent.

Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under fourth, and McCoy may be alphabetized under maccoy, while A1, A4, and A5 may all appear in numeric order alphabetized between a- and AA. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

---

**att.tableDecoration** provides attributes used to decorate rows or cells of a table. [[14. Tables, Formulæ, Graphics and Notated Music]]

*Module* tei

*Members* cell row

*Attributes* Attributes

@role indicates the kind of information held in this cell or in each cell of this row.

*Status* Optional

155
Datatype  [teidata.enumerated]

Suggested values include: label labelling or descriptive information only.

data  data values. [Default]

Note When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the role attribute of the parent <row> element.

@rows  indicates the number of rows occupied by this cell or row.

Status  Optional
Datatype  [teidata.count]
Default  1

Note A value greater than one indicates that this cell spans several rows. Where several cells span multiple rows, it may be more convenient to use nested tables.

@cols (columns) indicates the number of columns occupied by this cell or row.

Status  Optional
Datatype  [teidata.count]
Default  1

Note A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.

att.timed  provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [8.3.5. Temporal Information]

Module  tei
Members  gap
Attributes  Attributes

@start  indicates the location within a temporal alignment at which this element begins.

Status  Optional
Datatype  [teidata.pointer]

Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

@end  indicates the location within a temporal alignment at which this element ends.

Status  Optional
Datatype  [teidata.pointer]

Note If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

att.transcriptional  provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]
@status indicates the effect of the intervention, for example in the case of a
deletion, strikeouts which include too much or too little text, or in the case
of an addition, an insertion which duplicates some of the text already
present.

Status Optional
Datatype teidata.enumerated

Sample values include: duplicate all of the text indicated as an
addition duplicates some text that is in the original, whether
the duplication is word-for-word or less exact.

duplicate-partial part of the text indicated as an addition
duplicates some text that is in the original

excessStart some text at the beginning of the deletion is marked
as deleted even though it clearly should not be deleted.

excessEnd some text at the end of the deletion is marked as
deleted even though it clearly should not be deleted.

shortStart some text at the beginning of the deletion is not
marked as deleted even though it clearly should be.

shortEnd some text at the end of the deletion is not marked as
deleted even though it clearly should be.

partial some text in the deletion is not marked as deleted even
though it clearly should be.

unremarkable the deletion is not faulty. [Default]

Note Status information on each deletion is needed rather rarely except
in critical editions from authorial manuscripts; status information
on additions is even less common.

Marking a deletion or addition as faulty is inescapably an
interpretive act; the usual test applied in practice is the linguistic
acceptability of the text with and without the letters or words in
question.

@cause documents the presumed cause for the intervention.

Status Optional
Datatype teidata.enumerated

@seq (sequence) assigns a sequence number related to the order in which the
encoded features carrying this attribute are believed to have occurred.

Status Optional
Datatype teidata.count
Module tei

Attributes Attributes

@type characterizes the element in some sense, using any convenient classification scheme or typology.

Status Optional

Datatype teidata.enumerated

Note The type attribute is present on a number of elements, not all of which are members of att.typed, usually because these elements restrict the possible values for the attribute in a specific way.

Schematron <sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>

Note When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the <valList> element in the project-specific schema description, as described in 23.3.1.4. Modification of Attribute and Attribute Value Lists.

att.written provides an attribute to indicate the hand in which the textual content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

Module tei

Members att.transcriptional[add del closer head hi label note opener p postscript salute seg signed text]

Attributes Attributes

@hand points to a <handNote> element describing the hand considered responsible for the textual content of the element concerned.

Status Optional

Datatype teidata.pointer

B.4 Macros

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]
**macro.paraContent** (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

**Module** tei

**Used by** desc

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.limitedPhrase"/>
    <classRef key="model.inter"/>
  </alternate>
</content>
```

**Declaration**

```
macro.limitedContent = ( text | model.limitedPhrase | model.inter )*
```

**macro.paraContent**

**Module** tei

**Used by** ab add b del docEdition hi i p ref salute seg signed smcap sub sup title titlePart ul unclear

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>

**Content model**
B FORMAL SPECIFICATION

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

Module tei
Used by resp
Content model

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

Module tei
Used by cell item note q stage
Content model
teidata.certainty defines the range of attribute values expressing a degree of certainty.

Module tei

Used by teidata.probCert

Content model

```
<content>
  <valList type="closed">
    <valItem ident="high"/>
    <valItem ident="medium"/>
    <valItem ident="low"/>
    <valItem ident="unknown"/>
  </valList>
</content>
```

Declaration

```
teidata.certainty = "high" | "medium" | "low" | "unknown"
```

Note Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

---

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.

Module tei

Used by Element:
- colShift/@cols
- table/@rows
- table/@cols

Content model

```
<content>
  <dataRef name="nonNegativeInteger"/>
</content>
```

Declaration

```
teidata.count = xsd:nonNegativeInteger
```
B FORMAL SPECIFICATION

Note  Any positive integer value or zero is permitted

**teidata.duration.iso** defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats

*Module* tei
*Used by*
*Content model*

```xml
<content>
<dataRef name="token"
    restriction="[0-9.,DHMPRSTWYZ/:+\-]+"/>
</content>
```

*Declaration*

```xml
<teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+\-]+" }>
```

*Example*

```xml
<time dur-iso="PT0.75H">three-quarters of an hour</time>
```

*Example*

```xml
<date dur-iso="P1,5D">a day and a half</date>
```

*Example*

```xml
<date dur-iso="P14D">a fortnight</date>
```

*Example*

```xml
<time dur-iso="PT0.02S">20 ms</time>
```

**Note** A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see ISO 8601 *Data elements and interchange formats — Information interchange — Representation of dates and times.*

**teidata.duration.w3c** defines the range of attribute values available for representation of a duration in time using W3C datatypes.

*Module* tei
*Used by*
*Content model*

```xml
<content> <dataRef name="duration"/></content>
```

*Declaration*

```xml
<teidata.duration.w3c = xsd:duration>
```

*Example*
<time dur="PT45M">forty-five minutes</time>

Example

<date dur="P1DT12H">a day and a half</date>

Example

<date dur="P7D">a week</date>

Example

<time dur="PT0.02S">20 ms</time>

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.

For complete details, see the W3C specification.

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

Module tei

Used by Element:

- gap/@reason
- list/@type
- num/@type
- a/@type
- title/@type
- title/@type
- titlePage/@type
- titlePart/@type

Content model

```
<content> <dataRef key="teidata.word"/> </content>
```

Declaration

```
teidata.enumerated = teidata.word
```

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a <vallist> element.

---

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]

Module tei
B FORMAL SPECIFICATION

Used by
Content model

```
<content>
 <alternate>
  <dataRef name="language"/>
  <valList>
   <valItem ident=""/>
  </valList>
 </alternate>
</content>
```

Declaration \texttt{teidata.language = xsd:language | ( "" )}

Note The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A language tag, per BCP 47, is assembled from a sequence of components or \textit{subtags} separated by the hyphen character (\text{-}, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

**language** The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at \url{http://www.iana.org/assignments/language-subtag-registry}. It is recommended that this code be written in lower case.

**script** The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at \url{http://unicode.org/iso15924/iso15924-codes.html}. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

**region** Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at \url{https://www.iso.org/obp/ui/#search/code/}. The latter consist of 3 digits; the list of codes can be found at \url{http://unstats.un.org/unsd/methods/m49/m49.htm}.

**variant** An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.

**extension** An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

**private use** An extension that uses the initial subtag of the single letter \textit{x} (i.e., starts with \texttt{x-}) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the
Interoperability that use of RFC 4646 is intended to promote. In order for a
document that makes use of these subtags to be TEI-conformant, a
corresponding `<language>` element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the
IANA registry that do not match the above syntax, but are present because they
have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags
start with `x-`, and do not need to follow any further rules established by the IETF
and endorsed by these Guidelines. Like all language tags that make use of private
use subtags, the language in question must be documented in a corresponding
`<language>` element in the TEI header.

Examples include

- **sn** Shona
- **zh-TW** Taiwanese
- **zh-Hant-HK** Chinese written in traditional script as used in Hong Kong
- **en-SL** English as spoken in Sierra Leone
- **pl** Polish
- **es-MX** Spanish as spoken in Mexico
- **es-419** Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP
47, Language tags in HTML and XML.

---

**teidata.numeric** defines the range of attribute values used for numeric values.

**Module** tei

**Used by**

**Content model**

```xml
<content>
  <alternate>
    <dataRef name="double"/>
    <dataRef name="token"
      restriction="(-?[\d]+/\-?[\d]+)"/>
    <dataRef name="decimal"/>
  </alternate>
</content>
```

**Declaration**

```xml
teidata.numeric =
  xsd:double | token { pattern = "(-?[\d]+/\-?[\d]+)" } | xsd:decimal
```

**Note** Any numeric value, represented as a decimal number, in floating point format, or as
a ratio.

To represent a floating point number, expressed in scientific notation, E notation, a
variant of exponential notation, may be used. In this format, the value is expressed
as two numbers separated by the letter E. The first number, the significand
(sometimes called the mantissa) is given in decimal format, while the second is an
integer. The value is obtained by multiplying the mantissa by 10 the number of
times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

\textbf{teidata.outputMeasurement} defines a range of values for use in specifying the size of an object that is intended for display.

\textit{Module} tei

\textit{Used by}

\textit{Content model}

\begin{verbatim}
<content>
 <dataRef name="token"
   restriction="[\-+]?\d+(\.\d+)?(\%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"/>
</content>
\end{verbatim}

\textit{Declaration}

\begin{verbatim}
teidata.outputMeasurement =
  token
  { pattern = "[\-+]?\d+(\.\d+)?(\%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"
  }
\end{verbatim}

\textit{Example}

\begin{verbatim}
<figure>
 <head>The TEI Logo</head>
 <figDesc>Stylized yellow angle brackets with the letters mentioned TEI</figDesc>
 in mentioned text encoding initiative mentioned underneath, all on a white background.</figDesc>
 <graphic height="600px" width="600px"
   url="http://www.tei-c.org/logos/TEI-600.jpg"/>
</figure>
\end{verbatim}

\textit{Note} These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

\textbf{teidata.point} defines the data type used to express a point in cartesian space.

\textit{Module} tei

\textit{Used by}

\textit{Content model}

\begin{verbatim}
<content>
 <dataRef name="token"
   restriction="(\-?[0-9]\+[.][0-9]*,\-?[0-9]\+[.][0-9]*)"/>
</content>
\end{verbatim}
teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei

Used by Element:

• `handShift/@new`

Content model

```xml
<content> <dataRef name="anyURI"/></content>
```

Declaration

```xml
teidata.pointer = xsd:anyURI
```

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

Module tei

Used by

Content model

```xml
<content>
<alternate>
<dataRef key="teidata.probability"/> 
<dataRef key="teidata.certainty"/> 
</alternate>
</content>
```

Declaration

```xml
teidata.probCert = teidata.probability | teidata.certainty
```
teidata.probability defines the range of attribute values expressing a probability.

Module tei

Used by [teidata.probCert]

Content model

```
<content> <dataRef name="double"/></content>
```

Declaration

```
teidata.probability = xsd:double
```

Note Probability is expressed as a real number between 0 and 1; 0 representing certainly false and 1 representing certainly true.

---

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module tei

Used by Element:

- docDate/@when

Content model

```
<content>
<alternate>
 <dataRef name="date"/>
 <dataRef name="gYear"/>
 <dataRef name="gMonth"/>
 <dataRef name="gDay"/>
 <dataRef name="gYearMonth"/>
 <dataRef name="gMonthDay"/>
 <dataRef name="time"/>
 <dataRef name="dateTime"/>
</alternate>
</content>
```

Declaration

```
teidata.temporal.w3c =
 xsd:date
 | xsd:gYear
 | xsd:gMonth
 | xsd:gDay
 | xsd:gYearMonth
 | xsd:gMonthDay
 | xsd:time
 | xsd:dateTime
```

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

---

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of unicode characters possibly including whitespace.

Module tei
teidata.truthValue defines the range of attribute values used to express a truth value.

Module tei
Used by

Content model
\[<\text{content}> <\text{dataRef name="boolean"}/></\text{content}>\]

Declaration
\[\text{teidata.truthValue = xsd:boolean}\]

Note The possible values of this datatype are 1 or true, or 0 or false.
This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g., unknown, or inapplicable, it should have the extended version of this datatype: data.xTruthValue.

teidata.versionNumber defines the range of attribute values used for version numbers.

Module tei
Used by

Content model
\[<\text{content}> <\text{dataRef name="token" restriction="([d]+[a-z]*[d]*([.][d]+[a-z]*[d]*){0,3})"}/></\text{content}>\]

Declaration
\[\text{teidata.versionNumber = token \{ pattern = "([d]+[a-z]*[d]*([.][d]+[a-z]*[d]*){0,3}\)" }\]

teidata.word defines the range of attribute values expressed as a single word or token.

Module tei
Used by teidata.enumerated

Element:
- colShift/@ed
- unclear/@reason

Content model
\[<\text{content}> <\text{dataRef name="token" restriction="(\p{L}|\p{N}|\p{P}|\p{S})+"}/></\text{content}>\]
C ACKNOWLEDGMENTS

Declaration

\[
\text{teidata.word} = \text{token} \{ \text{pattern} = "(\p{L}|\p{N}|\p{P}|\p{S})+" \}
\]

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

\text{teidata.xpath} \text{ defines attribute values which contain an XPath expression.}

\text{Module tei}

\text{Used by}

\text{Content model} \text{<content> <textNode/> </content>}

\text{Declaration} \text{teidata.xpath} = \text{text}

\text{Note} Any XPath expression using the syntax defined in XSLT2

C Acknowledgments

The TEI Tite is simply a synthesis of work done at the

- University of Michigan Digital Library Production Service,
- University of Virginia Digital Library Production Service,
- and the California Digital Library

and represented in their documents

- Minimum standards for text capture,
- Text Encoding Guidelines for Keyboarding Vendors,
- and CDL TEI Base Encoding Guidelines,

respectively. Many thanks to the institutions and individuals responsible for sharing their experience and expertise for the benefit of the TEI community at large.

Also, thank you to members of the TEI Special Interest Group on Libraries who provided very valuable corrections and suggestions.
