1 Introduction

TEI Tite is a constrained customization of TEI designed for use when outsourcing production of TEI documents to vendors, who use some combination of OCR and keyboarding to produce encoded text. While the canonical version of Tite is maintained by the TEI Council, a derived version is used in the AccessTEI program.

TEI Tite is meant to express a transitional format for documents, not an archival one. A project outsourcing encoding of documents using Tite should convert Tite documents created by vendors into a more suitable format for long-term preservation, such as one of the encoding levels of Best Practices for TEI in Libraries or a project-specific TEI customization.

While Tite includes only a limited set of all of the elements in TEI, it should not be confused with TEI Lite, which also contains a subset of elements. What distinguishes Tite from other TEI customizations is that Tite is meant to prescribe exactly one way of encoding a particular feature of a document in as many cases as possible, ensuring that any two encoders would produce the same XML document for a source document.

This document specifies how a source document should be encoded using TEI Tite. Its organizing model is roughly the structure of a TEI document itself, and it proceeds from high-level features to low, starting with general requirements, text structure, directions on when to group texts, considerations about type of text (genre and format), continuing down to instructions on marking phrase-level features, reference systems, and so forth. In its original ODD (one document does-it-all) format, this document can generate everything necessary for working in TEI Tite: both documentation (this Tite-specific prose as well as the full technical documentation for each of its elements) and schemas in either W3C Schema, RELAX NG, or XML DTD. Software utilities, including the Roma web tool, can generate these.

Tite uses a subset of the TEI’s elements, except for a few shortcut elements for the convenience of use by vendors (<b>, <i>, <ul>, <sup>, <sub>, <smcap>, <colShift/> and <ornament>) which can be transformed to normal TEI elements. Tite is also not a TEI-conformant customization since it breaks the TEI Abstract Model by omitting <teiHeader> for encoder convenience. That is, Tite was created primarily by removing elements and attributes from the TEI, and not from extensive modification. As a TEI customization, Tite inherits TEI semantics, and ambiguity in this specification should be resolved with reference to the TEI Guidelines. What makes Tite distinct is that where the TEI in general is famously tolerant of multiple methods of encoding a given feature, Tite seeks uniformity of encoding through constraint, via its stripped-down tag set and via this specification.

Tite can be used to encode printed prose, poetry, drama, newspapers, and anything else which can be described with the basic TEI building-blocks of divisions, paragraphs, line groups, and speeches.

In this documentation, document refers generally to the item (book, pamphlet, newspaper, etc.) to be encoded and text to either linguistic (as opposed to graphic) material or a logically distinct literary unit.

2 General Requirements

2.1 What to Capture

All printed material should be captured: all text (that is, printed characters) should be transcribed and the presence of graphical items or other non-transcribable elements should be indicated with markup.

2.2 End-of-line Hyphens

A distinction should be maintained in the electronic transcription between end-of-line or soft hyphens (an artifact of page layout) and hard hyphens (a linguistic feature). The former should be transcribed as the SOFT HYPHEN (U+00AD) character; the latter, as the HYPHEN-
MINUS (U+002D) character generally available on Western keyboards. In the rare case of coincidence of the two types — where a word that is normally hyphenated is split across a line break at its hyphen — the hyphen should be considered hard, and transcribed as the HYPHEN-MINUS.

2.3 Character Encoding
Characters should be encoded in UTF-8. For characters not easily input from the keyboard, use hexadecimal numeric entities (e.g. é, the small latin e with acute accent, is represented as &\#x00E9;).

2.4 Accuracy and Verification
The standard for accuracy of transcription should be at least 99.99% (1 error in 10,000 characters). The sample size for verification will be 5% of the total text.

2.5 Documenting the Encoding Process
Almost surely, difficult encoding situations will arise whose resolution may not be covered by this documentation or the TEI Guidelines. In such cases, it is important to document the markup choices that are made. To this end each encoded file should be accompanied by a document with such notes. These notes should reference features of a document that seem remarkable to encoders and how these were handled by encoders.

3 Global Text Structure

3.1 TEI Tite text structure
In TEI Tite, `<text>` is the root element, containing front matter, the body of the text, and back matter.

```xml
<text xml:id="unique-identifier">
  <front> <!-- front matter -->
  </front>
  <body> <!-- body of text -->
  </body>
  <back> <!-- back matter -->
  </back>
</text>
```

The `<text>`'s `xml:id` attribute should contain a unique identifier for the document being encoded.

Tite omits the `<teiHeader>` element as a convenience to transcribers. This departs from normal TEI practice, which requires `<TEI>` as the root element, containing `<teiHeader>` and `<text>` elements. In order to bring a document encoded in TEI Tite into adherence with the TEI Abstract Model, projects should add a teiHeader before engaging in post-transcription processing.

3.2 Groups of Texts
A document should be encoded as a group of texts only when each member of the group contains its own front or back matter (most often, a separate title page). In this case the `<group>` element should be a child of the `<text>` element, and should contain child `<text>` elements each containing a `<front>`, `<body>`, and `<back>` (each `<text>` need not have both front and back matter, but should have at least one). Note that this group of texts will still
have its own front and back matter. When dealing with a group of texts, the basic TEI text structure is modified to look like:

```xml
<bracket>
  <front>
  <!-- front matter for the group -->
  </front>
  <group>
    <text>
      <front>
      <!-- front matter of first text -->
      </front>
      <body>
      <!-- body of first text -->
      </body>
      <back>
      <!-- back matter of first text -->
      </back>
    </text>
    <text>
      <front>
      <!-- front matter of second text -->
      </front>
      <body>
      <!-- body of second text -->
      </body>
      <back>
      <!-- back matter of second text -->
      </back>
    </text>
    <!-- more texts or groups of texts here -->
  </group>
  <back>
  <!-- back matter for the group -->
  </back>
</text>
```

In cases where a document appears to contain a group of texts but the above condition is not met, encode each unit as a (numbered) `<div>` with an appropriate `type` attribute.

### 3.3 Structural Divisions

Tite uses numbered divisions: `<div1>` through `<div7>`, which stand for levels of nesting within a text. `<div1>`s nest inside or are contained by the `<front>`, `<body>`, and `<back>` elements, `<div2>`s nest inside or are contained by `<div1>`s, etc. The document’s table of contents is often a good place to find cues about where structural divisions start and end; other cues can be blank pages, recurring typographical or ornamental features, or a numbering system (“Chapter 5” etc.). Also, the presence of a heading will often indicate the beginning of a division.

The `type` attribute should be used to express the type of division being marked. Where present, use a name for division type given in the document itself. Though any constrained enumerated list of `type` values will have to be determined on a job-by-job basis, some examples of appropriate division types are:

- act
- article
- book
- chapter
3 GLOBAL TEXT STRUCTURE

• essay
• letter
• part
• scene
• section
• subsection

When a heading is present, encode it with the `<head>` element. If there is more than one heading at the beginning of a given division, encode each heading with its own `<head>` element, using the `type` attribute to distinguish them. Appropriate values are:

• main
• sub (subtitle)
• alt (alternate)
• desc (descriptive)

The `n` attribute should be used to record sequential labels associated with a structural division (numbers, numerals, letters). When present, these labels should also be transcribed within the content of `<head>` element. For instance:

```xml
<div1 n="III" type="part">
  <head>III: It Awakes</head>
</div1>
```

3.3.1 False Indicators

A divisional title is a page that resembles a half-title page: it displays the title or heading of a major structural unit on an otherwise blank page. Divisional titles should be encoded not with a separate `<div>` element, but as a `<head>` within the appropriate `<div>`. For half-title pages and similar fly-title pages see the section on Front Matter.

Another potential false indication of a new structural division is an ornament used as an informal division: a printer’s ornament of some sort, a string of asterisks or periods, or a horizontal line. Mark these with the special `<ornament>` element. If the ornament is a horizontal line or printer’s device or otherwise not transcribable, make the element empty and include an appropriate `type` attribute (line or ornament); if the ornament is made up of characters, transcribe the characters into the `<ornament>`’s content.

3.4 Front and Back Matter

Front and back matter should be encoded with the `<front>` and `<back>` elements, respectively. `<div1>` elements should contain the major sections and should be characterized by `type` attribute values. The exception, however, is the title page, which should be encoded with the `<titlePage>` element and its children. The `<titlePart>` element should have a `type` attribute with one of the following values:

• main
• sub (subtitle)
• desc (descriptive title)
• alt (alternate title)
• volume (volume information)

<titlePart type="volume"/> should be used to encode volume information wherever it is found on the title page, even if it is separated from the other title information. The elements that make up the <titlePage> content model are: <graphic>, <byline>, <epigraph>, <docTitle>, <titlePart>, <docAuthor>, <docEdition>, <docImprint>, <docDate>, <figure>, <ornament>.

Information on the verso of the title page should be included as well (after a <pb/>).

Common items to encode in front and back matter – and therefore common type attribute values for <front> and <back> divisions are:

**front**

• acknowledgements
• advertisement
• castlist
• contents
• dedication
• fly-title
• foreword
• introduction
• preface

**back**

• appendix
• bibliography
• colophon
• glossary
• index

_Half-title_ and _fly-title_ pages may be encountered in the front matter. A _half-title_ page precedes the title page proper and sometimes includes volume or series information; a _fly-title_ page comes at the very end of the front matter, just before the body. In the case of half-titles, encode these as <div1 type="half-title"> (with <titlePart> elements as appropriate); in the case of fly-titles, encode them likewise with <div1 type="fly-title">, making sure to make the fly-title division the last part of the front matter (and not the first part of the body, as may seem reasonable as well).

**4 Types of Text**

Tite is equipped to support basic encoding of several types of text: in terms of genre, it supports prose, verse, and drama, and in terms of format, it supports books, newspapers, pamphlets, and other similar printed material. Tite has special elements for letters, verse, drama, and newspapers.
4.1 Letters

<opener> and <closer> are elements designed to encode the beginning and ending sections of letters, prefaces, diary entries, or other personal types of writing. Both elements contain:

- <dateline>: for recording time and place of composition; use <date> with when value (in W3C format as in the TEI Guidelines) to record date information
- <signed>: for recording a signature
- <salute>: for recording salutation at the beginning ("Dear Roger," ) or end ("Yours truly,")

<opener> contains the additional elements <epigraph>, <argument>, and <byline>. <epigraph> will often be useful in the context of a letter. When encoding an epigraph, make sure to encode the content as you would any other feature, marking line groups, bibliographical elements, etc.

<argument> and <byline>, however, are not intended specifically for use with letters:

- <argument>: for a summary that precedes a division
- <byline>: for a statement of responsibility for the document

4.2 Verse

All verse should be encoded within at least one <lg> element, even when there are no distinct stanzas or when the verse is interspersed with prose. If it is known, use the type attribute to express the type of line group. Sometimes within a poem there is a question about what should be tagged as a <lg> or as a separate <div>. As a rough rule of thumb, if there is a title accompanying the division, use the <div> element; otherwise, use <lg>.

Each line of verse should be encoded with the <l> element, and care should be taken to distinguish these logical lines of verse from lines motivated by page layout. The latter should be encoded as <lb>s. Thus

> AS virtuous men pass mildly away, And whisper to their souls to go, Whilst some of their sad friends do say, "Now his breath goes," and some say, "No."

should be encoded as

<lg type="stanza">
<l>AS virtuous men pass mildly away,</l>
<l rend="indent(1)">And whisper to their souls to go,</l>
<l>Whilst some of their sad friends do say,</l>
<l rend="indent(1)">"Now his breath goes," and some say, "No."
</lg>

Also, as in the example above, use the rend attribute to mark when a line is indented more than its siblings. Use numbered indent values (e.g. indent(1), indent(2), etc.) to make clear levels of indentation.

4.3 Drama

The standard TEI elements for drama should be used: <sp>, <stage>, <speaker>. If the who attribute is used on <sp>, also transcribe who is given as the speaker, in whatever form it is written, in the <speaker> element. Short pieces of stage direction that accompany the speaker designation may be included in the <speaker> element.

Scenes and acts should be encoded as appropriately nested <div> elements with type attributes of scene or act, respectively. Cast lists can likewise be encoded using <div> and type="castlist".

Prologues and epilogues can be treated as <sp>s of their own, unless their structure would be better represented by nested <div> elements.
4.4 Newspapers

Tite includes the elements `<colShift/>` and `<cb>` which are well suited for the multi-column layout of newspapers. Additional relevant elements are: `<ref>`, to encode a pointer to the continuation of a story in a different column or on a different page; and `<figure>`, to describe illustrations, advertisements, and cartoons.

5 Block-level Features

5.1 Block Quotations

Use the `<q>` element to encode block quotations. A block quotation is indicated by its being set off from surrounding text either with extra line-spacing or margins or with a different typeface. If the quotation is of an entire text, use the `<floatingText>` element and its children inside the `<q>` element:

```xml
<div1 type="intro">
  <p>
    <!-- ... -->
  </p>
  <q>
    <floatingText>
      <body>
        <lg type="poem">
          <!-- poem -->
        </lg>
        <!-- ... poem -->
      </body>
    </floatingText>
  </q>
  <p>
    <!-- ... -->
  </p>
</div1>
```

If present, transcribe all quotation marks or other delimiters inside the `<q>` element.

5.2 Figures

Use the `<figure>` element to encode figures. If a figure has a heading or caption, encode it with the `<head>` element. If there is associated text, simply use a `<p>` to encode it.

5.3 Tables and Lists

Tables and lists are encoded as in the TEI Guidelines, but note the following.

If a cell in a table is a heading or a label, set the `role` attribute to `label`; if the cell contains data, there is no need to use `role`: data is the default. If a cell or row spans more than one column or row, use the `rows` or `cols` attributes set to the number of columns or rows that it spans.

If unsure about whether a structure is best encoded as a list or table, record it as a table only if it would not be properly understood without tabular layout.

Lists should be encoded as either sequences of `<items>` or `<label>-<item>` pairs. When items in the list contain a label, as in a gloss list, be sure to use the latter form.

5.4 Notes

Both the reference to the note in the running text and the note itself must be encoded. Use `<ptr>` or `<ref>` to encode the reference. If there is no reference in the text (often the case for marginal notes), supply a `<ptr>` element in a reasonable place in the text running beside the note. If there is a reference (number, symbol, etc.), use the `<ref>` element and include the
reference text as the content. In both cases, a target attribute must be supplied which contains the xml:id value of the associated <note>.

When encoding the note itself with the <note> element, the xml:id and place attributes must be supplied. See the TEI documentation for acceptable values for place; the most common will be foot, end, margin-left (-right, -top, -bot).

Transcribe the note directly after it is referenced in the document. In the case of notes without explicit reference (pointed to with <ptr>), set the anchored attribute to false.

5.5 divWrapper Elements

Elements that can appear at the beginning and end of structural divisions, such as <argument>, <epigraph>, and <opener>, are called divWrapper elements in the TEI class system. An argument is a summary of what is to come; be sure to distinguish this from a heading, which is a title for the division. If an epigraph comes with bibliographic or simple citation material, encode this as well. For example:

```
<epigraph>
  <cit>
    <q>"I have sworn upon the altar of God eternal hostility against every form of tyranny over the mind of man."</q>
    <bibl>
      <author>Thomas Jefferson.</author>
    </bibl>
  </cit>
</epigraph>
```

5.6 Uncertain Blocks

In rare cases where the logical identity of a block-level element is hard to discern, use the TEI element <ab> (anonymous block) instead of applying a <p> or <div> element. In these cases, be sure to document this decision in accompanying notes. Applying this element should be viewed as a last resort.

The <gap> element should be used when for some reason the document being transcribed contains illegible text (smudged, torn, missing, etc.) or something outside the scope of transcription for a given project: characters in an unsupported character set, for instance. <gap> indicates that something is omitted. When using <gap>, set the reason attribute to an appropriate value. (See <unclear> below.)

6 Phrase-level Features

6.1 Typographical Changes

There are six elements in Tite that capture specific typographical features:

for bold-face glyphs

for italicized glyphs

for underlined glyphs

for glyphs in small-caps

for glyphs in subscript
These mark the physical change, and are agnostic about a logical motivation for it. There are two exceptions to this approach, however: marking foreign words and titles. In the case of foreign words, use the `<foreign>` element; in the case of titles, use the `<title>` element only if certain that the word or phrase in question is a title. If a phrase is, say, italicized, but you are uncertain about its being a title, use the `<i>` element instead. Foreign words should be marked only if they are typographically distinguished from surrounding text.

In addition, the `<handshift>` element may be used within the body of a transcription to indicate where a change of hand is detected for whatever reason.

If there is a typographical feature not covered by the above elements, the TEI `<hi>` element is still available in Tite. Use it without a `rend` attribute.

### 6.2 Phrase-level Quotation

For passages set off by quotation marks or another delimiter, use the `<q>` element, including the delimiter inside the tag.

### 6.3 Alignment and Indentation

If the alignment of an element seems remarkable, set the element’s `rend` attribute to an appropriate value (normally center, right, left, etc.). However, when semantic already accounts for its cause, description of alignment is not necessary. Headings, for instance, do not need to be marked as being centered.

To indicate level of indentation (often in verse), use numerical arguments to indent, as in `indent(1)`, `indent(-1)`, and so on.

### 6.4 Uncertain Segments

The `<seg>` element is the phrase-level analogue to the `<ab>` element. If a phrase-level feature seems to be present but its identity is hard to fathom, use this element. This, again, is a last resort.

Alternately, when a passage of text is for some reason too hard to read, use the `<unclear>` element, setting the `reason` attribute to an appropriate value. When using `<unclear>`, surround the entire word with the tag if any part of it is unclear (not just the illegible letter, say).

### 6.5 Unknown Glyphs

For cases in which it is unknown which character a given glyph corresponds to, mark the glyph with the `<g>` element to indicate the uncertainty. By convention in Tite, `<g>` represents any unknown glyph: no `ref` attribute is necessary. Note that unknown glyphs are different from illegible text.

### 7 Reference Systems

Encode page breaks `<pb>` at the start of each page, and encode breaks even for blank pages. If the page is numbered, include the page number as the value of the `n` attribute and, again, no matter where the page number is printed on the page, place the `<pb>` element at the top.

If marking column breaks, follow the same rules as for page breaks. Column breaks are imagined to appear at the top of the column, at the beginning of the column’s text. The `<colShift/>` element exists to record a change in columnar layout. If such a change occurs, mark the beginning of the new layout with `<colShift/>` and supply the new number of columns as the value for the `n` attribute.

For many applications, it will not be important to capture line breaks in ordinary prose text, but in cases where they are purposeful (such as the layout of acrostics, or where a word is broken across a line), they should be captured using the `<lb>` element, placing it at the start of each line.
Appendices

A  TEI Tite and the Best Practices for TEI in Libraries

The Best Practices for TEI in Libraries ("BP") creates common definitions of levels of encoding based on depth of markup applied. Because the levels of encoding provide a tremendously useful common set of terms, it’s helpful to situate TEI Tite according to them.

Mapped to BP levels, TEI Tite would sit between Level 3 and Level 4: it requires use of all the elements from Level 3 plus additional ones, but requires fewer elements than Level 4. Relative to Level 3, Simple Analysis, Tite

- encourages the use of the *rend* attribute on typographically distinct text (marked with `<hi>`), implicitly, through the provision of convenience elements (`<i>`, `<b>`, etc.), and it provides the `<title>` and `<foreign>` elements for semantic markup of typographically distinct phrases; in level 3, the *rend* attribute is optional, and `<title>` and `<foreign>` are not provided
- provides some genre-specific elements in addition to those for verse that level three also provides (`<lg>`, `<l>`): `<sp>`, `<speaker>`, and `<stage>` for drama, the `<colShift/>` element especially for newspapers.

The most useful comparison for Tite is to Level 4 (Basic Content Analysis), provides the most useful comparison. The following items represent instances where Tite is less ambitious than Level 4:

- except in the case of the `<foreign>` and `<title>` elements, it is preferred in Tite to describe typographical changes physically, rather than semantically; Tite uses `<i>`, `<b>`, etc. where level four uses `<emph>`, `<gloss>`, `<term>`
- Tite provides only `<q>` for quoted material, where level four is more discriminating, using `<quote>`, `<said>`, `<mentioned>`, `<soCalled>`
- Tite doesn’t provide elements for editorial intervention, as level four does: `<choice>`, `<sic>`, `<corr>`
- Tite doesn’t provide entity-specific naming elements, like `<persName>`, `<placeName>`, `<orgName>` and their list- `<listPerson>`, etc.) forms

Bringing Tite-encoded documents up to BP Level 4 would simply require application of additional markup, not significant reworking of markup, and in that way Tite is compatible with the BP.

Do also keep in mind that Tite lacks both the `<teiHeader>` and root `<TEI>` element used in TEI-conformant documents.

B  Formal specification

B.1  Elements

<ab> (anonymous block) contains any arbitrary component-level unit of text, acting as an anonymous container for phrase or inter level elements analogous to, but without the semantic baggage of, a paragraph. [16.3. Blocks, Segments, and Anchors]
May contain

The `<ab>` element may be used at the encoder’s discretion to mark any component-level elements in a text for which no other more specific appropriate markup is defined.

Example

```
<div type="book" n="Genesis">
  <div type="chapter" n="1">
    <ab>In the beginning God created the heaven and the earth.</ab>
    <ab>And the earth was without form, and void; and darkness was upon the face of the deep. And the spirit of God moved upon the face of the waters.</ab>
    <ab>And God said, Let there be light: and there was light.</ab>
  </div>
</div>
```

Schematron `<s:report test="not(ancestor::tei:floatingText) and (ancestor::tei:p or ancestor::tei:ab) and not(parent::tei:exemplum |parent::tei:item |parent::tei:note |parent::tei:q |parent::tei:quote |parent::tei:remarks |parent::tei:said |parent::tei:sp |parent::tei:stage |parent::tei:cell |parent::tei:figure)""> Abstract model violation: ab may not occur inside paragraphs or other ab elements. </s:report>`

Schematron `<s:report test="ancestor::tei:l or ancestor::tei:lg"> Lines may not contain higher-level divisions such as p or ab. </s:report>`

character data

Note Addresses may be encoded either as a sequence of lines, or using any sequence of component elements from the model.addrPart class. Other non-postal forms of address, such as telephone numbers or email, should not be included within an <address> element directly but may be wrapped within an <addrLine> if they form part of the printed address in some source text.

Example

```xml
<address>
 <addrLine>Computing Center, MC 135</addrLine>
 <addrLine>P.O. Box 6998</addrLine>
 <addrLine>Chicago, IL</addrLine>
 <addrLine>60680 USA</addrLine>
</address>
```

Example

```xml
<addrLine>
 <ref target="tel:+1-201-555-0123">(201) 555 0123</ref>
</addrLine>
```

Content model
<content>
<macroRef key="macro.phraseSeq"/>
</content>

Schema Declaration

element addrLine { att.global.attributes, macro.phraseSeq }

<address> contains a postal address, for example of a publisher, an organization, or an
individual. [3.5.2. Addresses 2.2.4. Publication, Distribution, Licensing, etc.
3.11.2.4. Imprint, Size of a Document, and Reprint Information]

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)

figures: figure

Note This element should be used for postal addresses only. Within it, the generic element
<addrLine> may be used as an alternative to any of the more specialized elements
available from the model.addrPart class, such as <street>, <postCode> etc.

Example Using just the elements defined by the core module, an address could be
represented as follows:

<Address>
<street> via Marsala 24</street>
<postCode>40126</postCode>
<name>Bologna</name>
<name>Italy</name>
</address>

Example When a schema includes the names and dates module more specific elements
such as country or settlement would be preferable over generic <name>:

<Address>
<street> via Marsala 24</street>
<postCode>40126</postCode>
<argument>

Example

```xml
<address>
  <addrLine>Computing Center, MC 135</addrLine>
  <addrLine>P.O. Box 6998</addrLine>
  <addrLine>Chicago, IL 60680</addrLine>
  <addrLine>USA</addrLine>
</address>
```

Example

```xml
<address>
  <country key="FR"/>Lyon</settlement>
  <postCode>69002</postCode>
  <district type="arrondissement">IIème</district>
  <district type="quartier">Perrache</district>
  <street>
    <num>30</num>, Cours de Verdun
  </street>
</address>
```

Content model

```xml
<content>
  <sequence>
    <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    <sequence minOccurs="1" maxOccurs="unbounded">
      <classRef key="model.addrPart"/>
      <classRef key="model.global" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
  </sequence>
</content>
```

Schema Declaration

```
<element address {
  att.global.attributes, 
  ( model.global*, ( model.addrPart, model.global* )+ )
}
```

<argument> contains a formal list or prose description of the topics addressed by a subdivision of a text. [4.2. Elements Common to All Divisions] [4.6. Title Pages]

caracter data

Note
Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes key or ref may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as Unknown or Anonymous. When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

Example

```
<author>British Broadcasting Corporation</author>
<author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de (1634–1693)</author>
<author>Anonymous</author>
<author>Bill and Melinda Gates Foundation</author>
<author>
<persName>Beaumont, Francis</persName> and
<persName>John Fletcher</persName>
</author>
<author>

derived-module-tei_tite: b i smcap sub sup ul
figures: cell figure table
linking: ab seg
May contain Empty element

Note On this element, the global n attribute indicates the number or other value associated with the column which follows the point of insertion of this <cb> element. Encoders should adopt a clear and consistent policy as to whether the numbers associated with column breaks relate to the physical sequence number of the column in the whole text, or whether columns are numbered within the page. The <cb> element is placed at the head of the column to which it refers.

Example Markup of an early English dictionary printed in two columns:

```xml
<pb/>
<cb n="1"/>
<form>Well</form>, <sense>a Pit to hold Spring-Water</sense>:
<sense>In the Art of <hi rend="italic">War</hi>, a Depth the Miner sinks into the Ground, to find out and disappoint the Enemies Mines, or to prepare one</sense>.
</entryFree>
<entryFree>To <form>Welter</form>, <sense>to wallow</sense>, or <sense>lie groveling</sense>.</entryFree>
<!-- remainder of column -->
<cb n="2"/>
<entryFree>
<form>Wey</form>, <sense>the greatest Measure for dry Things, containing five Chaldron</sense>.
</entryFree>
<entryFree>
<form>Whale</form>, <sense>the greatest of Sea-Fishes</sense>.
</entryFree>
```

Content model `<content> <empty/></content>`

This element should be used for deletion of shorter sequences of text, typically single words or phrases. The `<delSpan>` element should be used for longer sequences of text, for those containing structural subdivisions, and for those containing overlapping additions and deletions.

The text deleted must be at least partially legible in order for the encoder to be able to transcribe it (unless it is restored in a `<supplied>` tag). Illegible or lost text within a deletion may be marked using the `<gap>` tag to signal that text is present but has not been transcribed, or is no longer visible. Attributes on the `<gap>` element may be used to indicate how much text is omitted, the reason for omitting it, etc. If text is not fully legible, the `<unclear>` element (available when using the additional tagset for transcription of primary sources) should be used to signal the areas of text which cannot be read with confidence in a similar way.

Degrees of uncertainty over what can still be read, or whether a deletion was intended may be indicated by use of the `<certainty>` element (see 21. Certainty, Precision, and Responsibility).

There is a clear distinction in the TEI between `<del>` and `<surplus>` on the one hand and `<gap>` or `<unclear>` on the other. `<del>` indicates a deletion present in the source being transcribed, which states the author’s or a later scribe’s intent to cancel or remove text. `<surplus>` indicates material present in the source being transcribed which should have been so deleted, but which is not in fact. `<gap>` or `<unclear>`, by contrast, signal an editor’s or encoder’s decision to omit something or their inability to read the source text. See sections 11.3.1.7. Text Omitted from or Supplied in the Transcription and 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for the relationship between these and other related elements used in detailed transcription.

**Example**

```xml
<l>
  <del rend="overtyped">Mein</del> Frisch
  <del rend="overstrike" type="primary">schwebt</del>
  weht der Wind
</l>
```

**Example**

```xml
<del rend="overstrike">
  <gap reason="illegible" quantity="5"
       unit="character"/>
</del>
```

**Content model**

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

**Schema Declaration**
<desc> (description) contains a brief description of the object documented by its parent element, typically a documentation element or an entity. [22.4.1. Description of Components]

Module core
Attributes
att.global (@xml:id, @n, @xml:lang, @xml:space)

Note When used in a specification element such as `<elementSpec>`, TEI convention requires that this be expressed as a finite clause, beginning with an active verb.

Example

```xml
<desc>contains a brief description of the purpose and intended use of a documentation element, or a brief characterisation of a parent entity</desc>
```

Schematron A `<desc>` with a type of deprecationInfo should only occur when its parent element is being deprecated. Furthermore, it should always occur in an element that is being deprecated when `<desc>` is a valid child of that element.

```xml
<sch:rule context="tei:desc[@type eq 'deprecationInfo']">
  <sch:assert test="../@validUntil">Information about a deprecation should only be present in a specification element that is being deprecated; that is, only an element that has a @validUntil attribute should have a child `<desc type="deprecationInfo"></desc>`.</sch:assert>
</sch:rule>
```

Content model

Note any sequence of low-level structural elements, possibly grouped into lower subdivisions.

Example

&lt;div2 type="chapter"&gt;
  &lt;head&gt;Recipes&lt;/head&gt;
  &lt;head&gt;Chapter VI.&lt;/head&gt;
&lt;div3&gt;
  &lt;head&gt;Fruit and vegetable soups&lt;/head&gt;
  &lt;p&gt;...&lt;/p&gt;
&lt;div4&gt;
  &lt;head&gt;Stocks for all kinds of soups&lt;/head&gt;
  &lt;div5 type="recipe"&gt;
    &lt;head&gt;Rich strong stock&lt;/head&gt;

Medium Stock

Ingredients
- 2 lbs. of good boiling apples,
- 3/4 teaspoonful of white pepper,
- 6 cloves,
- cayenne or ginger to taste,
- 3 quarts of medium stock

Mode
Peel and quarter the apples taking out their cores; put them into the stock, stew them gently till tender, Rub the whole through a strainer, add the seasoning. give it one boil up, and serve.

Time
1 hour.

Average cost
per quart, 1s.

Seasonable
from September to December.

Sufficient
for 10 persons.

The apple
This useful fruit is mentioned in Holy Writ; and Homer describes it as valuable in his time... As a food, the apple cannot be considered to rank high, as more than the half of it consists of water, and the rest of its properties are not the most nourishing. It is however a useful adjunct to other kinds of food, and, when cooked, is esteemed as slightly laxative.

</div>
<docAuthor> (document author) contains the name of the author of the document, as given on the title page (often but not always contained in a byline). [4.6. Title Pages]

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source))

Member of model.divWrapper | model.pLike.front | model.titlepagePart

Contained by
core: [lg | list]
figures: [figure | table]
textstructure: [back | body | byline | div1 | div2 | div3 | div4 | div5 | div6 | div7 | front | group | titlePage]
May contain
core: [abbr | add | address | cb | cit | date | del | email | foreign | gap | graphic | hi | lb | milestone | name | note | num | pb | ptr | ref | time | title | unclear]
derived-module-tei_tite: [b | colShift | i | smcap | sub | sup | ul]
figures: [figure | formula]
gaiji: [g]
linking: [seg]
textstructure: [floatingText]
transcr: [handShift]
character data

Note The document author’s name often occurs within a byline, but the <docAuthor> element may be used whether the <byline> element is used or not. It should be used only for the author(s) of the entire document, not for author(s) of any subset or part of it. (Attributions of authorship of a subset or part of the document, for example of a chapter in a textbook or an article in a newspaper, may be encoded with <byline> without <docAuthor>.)

Example

<titlePage>
<docTitle>
Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element docAuthor { att.global.attributes, macro.phraseSeq }
```

<docDate> (document date) contains the date of a document, as given on a title page or in a dateline. [4.6. Title Pages]

Module textstructure

Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
  (att.global.change (@change)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source))
@when gives the value of the date in standard form, i.e. YYYY-MM-DD.

Status Optional

Datatype teidata.temporal.w3c

Note For simple dates, the when attribute should give the Gregorian or proleptic Gregorian date in one of the formats specified in XML Schema Part 2: Datatypes Second Edition.

Member of model.divWrapper model.pLike.front model.titlepagePart

Contained by core: lg list

figures: figure table

textstructure: back body dateline div1 div2 div3 div4 div5 div6 div7 docImprint front
group titlePage

May contain core: abbr add address cb cit date del email foreign gap graphic hi lb milestone name note num ph ptr ref time title unclear
derived-module-tei_tite: b colShift i smcap sub sup ul

figures: figure formula

gaiji: g

linking: seg

textstructure: floatingText

transcr: handShift

character data
Note  Cf. the general <date> element in the core tag set. This specialized element is provided for convenience in marking and processing the date of the documents, since it is likely to require specialized handling for many applications. It should be used only for the date of the entire document, not for any subset or part of it.

Example

<docImprint>Oxford, Clarendon Press, <docDate>1987</docDate></docImprint>

Content model

```xml
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```xml
element docDate
{
  att.global.attributes,
  attribute when { text }?,
  macro.phraseSeq
}
```

Module textstructure

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch,
  @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
  (att.global.change (@change)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source))

Contained by textstructure: back front titlePage

May contain core: abbr add address bibl cb cit date del desc email foreign gap graphic hi label lb lg
  list listBibl milestone name note num pb ptr q ref stage time title unclear

derived-module-tei_tite: b colShift i ornament smcap sub sup ul

figures: figure formula table

gaiji: g

linking: seg

textstructure: floatingText

transcr: handShift

character data

Note  Cf. the <edition> element of bibliographic citation. As usual, the shorter name has been given to the more frequent element.

Example
<docImprint>

Content model

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```xml
element docEdition { att.global.attributes, macro.paraContent }
```

<docImprint> (document imprint) contains the imprint statement (place and date of publication, publisher name), as given (usually) at the foot of a title page. [4.6. Title Pages]

Module: textstructure

Attributes: Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
  (att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
  (att.global.change (@change)) (att.global.responsibility (@cert, @resp))
  (att.global.source (@source))

Member of model.pLike.front model.titlePagePart

Contained by
textstructure: back front titlePage

May contain
core: abbr add address cb date del email foreign gap graphic hi lb milestone name note num pb ptr pubPlace publisher ref time title unclear
derived-module-tei_tite: b colShift i smcap sub sup ul
figures: figure formula
gaiji: g
linking: seg
textstructure: docDate
transcr: handShift

character data

Note: Cf. the <imprint> element of bibliographic citations. As with title, author, and editions, the shorter name is reserved for the element likely to be used more often.

Example

Imprints may be somewhat more complex:

<docImprint>
  <pubPlace>London</pubPlace>
  Printed for <name>E. Nutt</name>, at
  <pubPlace>Royal Exchange</pubPlace>;
  <name>J. Roberts</name> in
  <pubPlace>wick-Lane</pubPlace>;
</docImprint>
A. Dodd without
Temple-Bar;
and J. Graves in
St. James's-street.

<docImprint>

Content model

<content>

**Note**

The global `xml:lang` attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in 6.1. Language Identification.

This element is intended for use only where no other element is available to mark the phrase or words concerned. The global `xml:lang` attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

The `<distinct>` element may be used to identify phrases belonging to sublanguages or registers not generally regarded as true languages.

**Example**

This is heathen Greek to you still? Your `<foreign xml:lang="la">lapis philosophicus</foreign>`?

**Content model**

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```
<formula> contains a mathematical or other formula.

Note Because cultural conventions differ as to which elements are grouped as front matter and which as back matter, the content models for the <front> and <back> elements are identical.

Example

<front>
  <epigraph>
    <quote>Nam Sibyllam quidem Cumis ego ipse oculis meis vidi in ampulla pendere, et cum illi pueri dicerent: <q xml:lang="gr">Σίβυλα τί Θέλεις</q>; respondebat illa: <q xml:lang="gr">ἀποθανεῖν Θέλω.</q>
  </quote>
  </epigraph>
  
  For Ezra Pound <q xml:lang="it">il miglior fabbro.</q>
</p>
</front>
Example

<front>
<div type="dedication">
<p>To our three selves</p>
</div>
<div type="preface">
<head>Author's Note</head>
<p>All the characters in this book are purely imaginary, and if the author has used names that may suggest a reference to living persons she has done so inadvertently. ...</p>
</div>
</front>

Example

<front>
<div type="abstract">
<div>
<head>BACKGROUND:</head>
<p>Food insecurity can put children at greater risk of obesity because of altered food choices and nonuniform consumption patterns.</p>
</div>
<div>
<head>OBJECTIVE:</head>
<p>We examined the association between obesity and both child-level food insecurity and personal food insecurity in US children.</p>
</div>
<div>
<head>DESIGN:</head>
<p>Data from 9,701 participants in the National Health and Nutrition Examination Survey, 2001-2010, aged 2 to 11 years were analyzed. Child-level food insecurity was assessed with the US Department of Agriculture's Food Security Survey Module based on eight child-specific questions. Personal food insecurity was assessed with five additional questions. Obesity was defined, using physical measurements, as body mass index (calculated as kg/m2) greater than or equal to the age- and sex-specific 95th percentile of the Centers for Disease Control and Prevention growth charts. Logistic regressions adjusted for sex, race/ethnic group, poverty level, and survey year were conducted to describe associations between obesity and food insecurity.</p>
</div>
<div>
<head>RESULTS:</head>
<p>Obesity was significantly associated with personal food insecurity for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to 2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95% CI 0.51 to 1.51). Child-level food insecurity was not associated with obesity among 2- to 5-year-olds or 6- to 11-year-olds.</p>
</div>
<div>
<head>CONCLUSIONS:</head>
<p>Personal food insecurity is associated with an increased risk of obesity only in children aged 6 to 11 years. Personal food-insecurity measures may give different results than aggregate
food-insecurity measures in children.
<g>(character or glyph) represents a glyph, or a non-standard character. [5. Characters, Glyphs, and Writing Modes]

May contain Character data only

Note The name g is short for gaiji, which is the Japanese term for a non-standardized character or glyph.

Example

```xml
<g ref="#ctlig">ct</g>
```

This example points to a <glyph> element with the identifier ctlig like the following:

```xml
<glyph xml:id="ctlig">
<!-- here we describe the particular ct-ligature intended -->
</glyph>
```

Example

```xml
<g ref="#per-glyph">per</g>
```

The medieval brevigraph per could similarly be considered as an individual glyph, defined in a <glyph> element with the identifier per_glyph as follows:

```xml
<glyph xml:id="per-glyph">
<!-- ... -->
</glyph>
```
<gap> indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible. [3.4.3. Additions, Deletions, and Omissions]

Module core

Attributes Attributes att.global (@xml:id, @p, @xml:lang, @xml:space)
(att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs)) (att.global.change (@change)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.timed (@start, @end)

@reason gives the reason for omission

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: cancelled
deleted
editorial for features omitted from transcription due to editorial policy
illegible
inaudible
irrelevant
sampling

May contain
core: desc

Note The <gap>, <unclear>, and <del> core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was
deliberately erased or covered, should be indicated using the relevant tags, such as `<del>` in the case of deliberate deletion.

Example

```
<gap quantity="4" unit="chars"
reason="illegible"/>
```

Example

```
<gap quantity="1" unit="essay"
reason="sampling"/>
```

Example

```
<del>
  <gap atLeast="4" atMost="8" unit="chars"
       reason="illegible"/>
</del>
```

Example

```
<gap extent="several lines" reason="lost"/>
```

Content model

- character data

Note: The `<head>` element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the
proper processing of a `<head>` element based on its structural position. A `<head>` occurring as the first element of a list is the title of that list; one occurring as the first element of a `<div>` is the title of that chapter or section.

**Example.** The most common use for the `<head>` element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a `section` has an explicit ending as well as a heading, it should be marked as a `<trailer>`, as in this example:

```
<div1 n="I" type="book">
    <head>In the name of Christ here begins the first book of the ecclesiastical history of Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
    <div2 type="section">
        <head>In the name of Christ here begins Book I of the history.</head>
        <p>Proposing as I do ...</p>
        <p>From the Passion of our Lord until the death of Saint Martin four hundred and twelve years passed.</p>
        <trailer>Here ends the first Book, which covers five thousand, five hundred and ninety-six years from the beginning of the world down to the death of Saint Martin.</trailer>
    </div2>
</div1>
```

**Example.** When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the `place` attribute.

```
<div type="subsection">
    <head place="margin">Secunda conclusio</head>
    <p>
        <lb n="1251"/>
        <hi rend="large">Potencia: habitus: et actus: recipiunt speciem ab obiectis</hi><supplied>...<</supplied>
        <hi>
            <lb n="1252"/>Probatur sic. Omne importans necessariam habitudinem ad proprium [...]
        </hi>
    </p>
</div>
```

**Example.** The `<head>` element is also used to mark headings of other units, such as lists:

```
With a few exceptions, connectives are equally useful in all kinds of discourse: description, narration, exposition, argument. <list rend="bulleted">
    <head>Connectives</head>
    <item>above</item>
    <item>accordingly</item>
    <item>across from</item>
    <item>adjacent to</item>
    <item>again</item>
</list>
```

character data

Note May contain simple prose or a sequence of chunks.

Whatever string of characters is used to label a list item in the copy text may be used as the value of the global n attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the n attribute on the <item> element is by definition synonymous with the use of the <label> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <label> element, not n.

Example

<list rend="numbered">
   <head>Here begin the chapter headings of Book IV</head>
   <item n="4.1">The death of Queen Clotild.</item>
   <item n="4.2">How King Lothar wanted to appropriate one third of the Church revenues.</item>
   <item n="4.3">The wives and children of Lothar.</item>
   <item n="4.4">The Counts of the Bretons.</item>
   <item n="4.5">Saint Gall the Bishop.</item>
   <item n="4.6">The priest Cato.</item>
   <item> ...</item>
</list>

**Example**

Labels are commonly used for the headwords in glossary lists; note the use of the global xml:lang attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:

```xml
<list type="gloss" xml:lang="enm">
    <head xml:lang="en">Vocabulary</head>
    <headLabel xml:lang="en">Middle English</headLabel>
    <headItem xml:lang="en">New English</headItem>
    <label>nu</label>
    <item xml:lang="en">now</item>
    <label>lhude</label>
    <item xml:lang="en">loudly</item>
    <label>bloweth</label>
    <item xml:lang="en">blooms</item>
    <label>med</label>
    <item xml:lang="en">meadow</item>
</list>
```
Example Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's Autobiography. In this usage the `<label>` element is synonymous with the `n` attribute on the `<item>` element:

I will add two facts, which have seldom occurred in the composition of six, or at least of five quartos.

```
<list rend="runon" type="ordered">
  <item>(1)</item> My first rough manuscript, without any intermediate copy, has been sent to the press.</item>
  <item>(2) </item> Not a sheet has been seen by any human eyes, excepting those of the author and the printer: the faults and the merits are exclusively my own.</item>
</list>
```

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

```
<list type="gloss">
  <label>March 1757.</label>
  <item>I wrote some critical observations upon Plautus.</item>
  <label>March 8th.</label>
  <item>I wrote a long dissertation upon some lines of Virgil.</item>
  <label>June.</label>
  <item>I saw Mademoiselle Curchod — Omnia vincit amor, et nos cedamus amori.</item>
  <label>August.</label>
  <item>I went to Crassy, and staid two days.</item>
</list>
```

Note that the `<label>` might also appear within the `<item>` rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

Example Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the `<label>` element appears within the `<p>` or `<lg>` element, rather than as a preceding sibling of it.
<p>...<lb>& n'entrer en mauvais & mal-heur-
<lb>/ment des parties y eft le mariage eft
<lb>/ arreté, quoy que de fait il ne foit
<label place="margin">Puiſſance maritale
entre les Romains.</label>
<lb/> conſommé. Depuis la conſomma-
<lb/>tion du mariage la femme eſt foubs
<lb/> la puifſance du mary, s'il n'eft efcla-
<lb/>ve ou enfant de famille : car en ce
<lb/> cas, la femme, qui a eſpouſé vn en-
<lb/>fant de famille, eſt foubs la puifſance
[...]</p>

In this example the text of the label appears in the right hand margin of the original
source, next to the paragraph it describes, but approximately in the middle of it. If
so desired the type attribute may be used to distinguish different categories of label.

```

derived-module-tei_tite: b i smcap sub sup ul

figures: cell figure table

linking: ab seg
May contain Empty element

Note By convention, `<lb>` elements should appear at the point in the text where a new line starts. The `n` attribute, if used, indicates the number or other value associated with the text between this point and the next `<lb>` element, typically the sequence number of the line within the page, or other appropriate unit. This element is intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the `<l>` element is available) except in circumstances where structural units cannot otherwise be marked.

The `type` attribute may be used to characterize the line break in any respect. The more specialized attributes `break`, `ed`, or `edRef` should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```
<lb>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the Fruit</lb>
<lb>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</lb>
<lb>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our woe.</lb>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The `break` attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```
<titlePart>
 <lb/>With Additions, ne<lb break="no"/>ver before Printed.
</titlePart>
```

```
<list>

contains any sequence of items organized as a list. 

3.7. Lists

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
att.global.rendition (@rend, @style))
att.global.linking (@corresp, @synch, 
@sameAs, @copyOf, @next, @prev, @exclude, @select))
att.global.facs (@facs)
att.global.change (@change))
att.global.responsibility (@cert, @resp))
att.global.source (@source)) att.sortable (@sortKey)

@type describes the nature of the items in the list.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: gloss each list item glosses some term or concept, which is given by a <label> element preceding the list item.

index each list item is an entry in an index such as the alphabetical topical index at the back of a print volume.

instructions each list item is a step in a sequence of instructions, as in a recipe.

litany each list item is one of a sequence of petitions, supplications or invocations, typically in a religious ritual.

syllogism each list item is part of an argument consisting of two or more propositions and a final conclusion derived from them.

Note Previous versions of these Guidelines recommended the use of type on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the rend or style attributes for these aspects of a list, while using type for the more appropriate task of characterizing the nature of the content of a list.

Note The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

Note May contain an optional heading followed by a series of items, or a series of label and item pairs, the latter being optionally preceded by one or two specialized headings.

Example

```xml
<list rend="numbered">
  <item>a butcher</item>
  <item>a baker</item>
  <item>a candlestick maker, with
    <list rend="bulleted">
      <item>rings on his fingers</item>
      <item>bells on his toes</item>
    </list>
  </item>
</list>
```

Example

```xml
<list type="syllogism" rend="bulleted">
  <item>All Cretans are liars.</item>
  <item>Epimenides is a Cretan.</item>
  <item>ERGO Epimenides is a liar.</item>
</list>
```

Example

```xml
<list type="litany" rend="simple">
  <item>God save us from drought.</item>
  <item>God save us from pestilence.</item>
  <item>God save us from wickedness in high places.</item>
  <item>Praise be to God.</item>
</list>
```

Example The following example treats the short numbered clauses of Anglo-Saxon legal codes as lists of items. The text is from an ordinance of King Athelstan (924–939):

```xml
<div1 type="section">
  <head>Athelstan's Ordinance</head>
  <list rend="numbered">
    <item n="1">Concerning thieves. First, that no thief is to be spared who is caught with the stolen goods, [if he is] over twelve years and [if the value of the goods is] over
```
eightpence.

<list rend="numbered">
  <item n="1.1">And if anyone does spare one, he is to pay for the thief with his wergild — and the thief is to be no nearer a settlement on that account — or to clear himself by an oath of that amount.</item>
  <item n="1.2">If, however, he [the thief] wishes to defend himself or to escape, he is not to be spared [whether younger or older than twelve].</item>
  <item n="1.3">If a thief is put into prison, he is to be in prison 40 days, and he may then be redeemed with 120 shillings; and the kindred are to stand surety for him that he will desist for ever.</item>
  <item n="1.4">And if he steals after that, they are to pay for him with his wergild, or to bring him back there.</item>
  <item n="1.5">And if he steals after that, they are to pay for him with his wergild, whether to the king or to him to whom it rightly belongs; and everyone of those who supported him is to pay 120 shillings to the king as a fine.</item>
</list>

Concerning lordless men. And we pronounced about these lordless men, from whom no justice can be obtained, that one should order their kindred to fetch back such a person to justice and to find him a lord in public meeting.

<list rend="numbered">
  <item n="2.1">And if they then will not, or cannot, produce him on that appointed day, he is then to be a fugitive afterwards, and he who encounters him is to strike him down as a thief.</item>
  <item n="2.2">And he who harbours him after that, is to pay for him with his wergild or to clear himself by an oath of that amount.</item>
</list>

Concerning the refusal of justice. The lord who refuses justice and upholds his guilty man, so that the king is appealed to, is to repay the value of the goods and 120 shillings to the king; and he who appeals to the king before he demands justice as often as he ought, is to pay the same fine as the other would have done, if he had refused him justice.

<list rend="numbered">
  <item n="3.1">And the lord who is an accessory to a theft by his slave, and it becomes known about him, is to forfeit the slave and be liable to his wergild on the first occasion if he does it more often, he is to be liable to pay all that he owns.</item>
  <item n="3.2">And likewise any of the king's treasurers or of our reeves, who has been an accessory of thieves who have committed theft, is to liable to
Concerning treachery to a lord. And we have pronounced concerning treachery to a lord, that he [who is accused] is to forfeit his life if he cannot deny it or is afterwards convicted at the three-fold ordeal.

Note that nested lists have been used so the tagging mirrors the structure indicated by the two-level numbering of the clauses. The clauses could have been treated as a one-level list with irregular numbering, if desired.

Example

These decrees, most blessed Pope Hadrian, we propounded in the public council ... and they confirmed them in our hand in your stead with the sign of the Holy Cross, and afterwards inscribed with a careful pen on the paper of this page, affixing thus the sign of the Holy Cross.

I, Eanbald, by the grace of God archbishop of the holy church of York, have subscribed to the pious and catholic validity of this document with the sign of the Holy Cross.

I, Ælfwold, king of the people across the Humber, consenting have subscribed with the sign of the Holy Cross.

I, Tilberht, prelate of the church of Hexham, rejoicing have subscribed with the sign of the Holy Cross.

I, Higbald, bishop of the church of Lindisfarne, obeying have subscribed with the sign of the Holy Cross.

I, Ethelbert, bishop of Candida Casa, suppliant, have subscribed with the sign of the Holy Cross.

I, Ealdwulf, bishop of the church of Mayo, have subscribed with devout will.

I, Æthelwine, bishop, have subscribed through delegates.

I, Sicga, patrician, have subscribed with serene mind with the sign of the Holy Cross.

May contain Empty element

Note For this element, the global n attribute indicates the new number or other value for the unit which changes at this milestone. The special value unnumbered should be used in passages which fall outside the normal numbering scheme, such as chapter or other headings, poem numbers or titles, etc.

The order in which <milestone> elements are given at a given point is not normally significant.

Example
<milestone n="23" ed="La" unit="Dreissiger"/>
... <milestone n="24" ed="AV" unit="verse"/>
...

Content model

```
<content> <empty/></content>
```

Schema Declaration

```
element milestone
{
  att.global.attributes,
  att.milestoneUnit.attributes,
  att.typed.attributes,
  empty
}
```

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

And yet it is not only in the great line of Italian renaissance art, but even in the painterly <note place="bottom" type="gloss" resp="#MDMH">
  <term xml:lang="de">Malerisch</term>. This word has, in the German, two distinct meanings, one objective, a quality residing in the object, the other subjective, a mode of apprehension and creation. To avoid confusion, they have been distinguished in English as <mentioned>picturesque</mentioned> and <mentioned>painterly</mentioned> respectively.
</note> style of the Dutch genre painters of the seventeenth century that drapery has this psychological significance.

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global $n$ attribute may be used to supply the symbol or number used to mark the note’s point of attachment in the source text, as in the following example:

Mevorakh b. Saadya’s mother, the matriarch of the family during the second half of the eleventh century, <note n="126" anchored="true"> The alleged mention of Judah Nagid’s mother in a letter from 1071 is, in fact, a reference to Judah’s children; cf. above, nn. 111 and 54. </note> is well known from Geniza documents published by Jacob Mann.

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Content model

May contain

- Empty element

Note

A `<pb>` element should appear at the start of the page which it identifies. The global `n` attribute indicates the number or other value associated with this page. This will normally be the page number or signature printed on it, since the physical sequence number is implicit in the presence of the `<pb>` element itself.

The `type` attribute may be used to characterize the page break in any respect. The more specialized attributes `break`, `ed`, or `edRef` should be preferred when the intent is to indicate whether or not the page break is word-breaking, or to note the source from which it derives.

Example

Page numbers may vary in different editions of a text.
**Example** A page break may be associated with a facsimile image of the page it introduces by means of the `facs` attribute.

```xml
<body>
  <pb n="1" facs="page1.png"/>
  <!-- page1.png contains an image of the page; the text it contains is encoded here -->
  <p>
  <!-- ... -->
  </p>
  <pb n="2" facs="page2.png"/>
  <!-- similarly, for page 2 -->
  <p>
  <!-- ... -->
  </p>
</body>
```

**Content model** `<content> <empty/></content>`

**Schema Declaration**

```
<element pb { att.global.attributes, att.typed.attributes, empty }
```

(q) (quoted) contains material which is distinguished from the surrounding text using quotation marks or a similar method, for any one of a variety of reasons including, but not limited to: direct speech or thought, technical terms or jargon, authorial distance, quotations from elsewhere, and passages that are mentioned but not used.

3.3.3. Quotation

Module core

Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)

(att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))

(att.global.change (@change)) (att.global.responsibility (@cert, @resp))

(att.global.source (@source)) att.ascribed.directed (@toWhom)

@type may be used to indicate whether the offset passage is spoken or thought, or to characterize it more finely.

Status Optional

Datatype teidata.enumerated

Suggested values include: spoken representation of speech

thought representation of thought, e.g. internal monologue

written quotation from a written source

soCalled authorial distance

foreign quotation from a written source

distinct linguistically distinct

term technical term

emph rhetorically emphasized

mentioned referring to itself, not its normal referent

Member of model.qLike

Contained by
Note May be used to indicate that a passage is distinguished from the surrounding text for reasons concerning which no claim is made. When used in this manner, \(<q>\) may be thought of as syntactic sugar for \(<hi>\) with a value of \(rend\) that indicates the use of such mechanisms as quotation marks.

Example

It is spelled \(<q>\)Tübingen</q> - to enter the letter \(<q>u</q>\) with an umlaut hold down the \(<q>option</q>\) key and press \(<q>0 0 f c</q>\)

Content model

```
<content>

Schema Declaration

element ref
{
  att.global.attributes,
<resp>

(responsibility) contains a phrase describing the nature of a person’s intellectual responsibility, or an organization’s role in the production or distribution of a work. Responsibilities may be described for a wide variety of roles, including authors, publishers, editors, translators, and more. Responsibilities are used to identify the role of those involved in the creation, production, or distribution of a work.

### Module: core

**Attributes**
- `att.global` (@xml:id, @n, @xml:lang, @xml:space)
- `att.global.rendition` (@rend, @style)
- `att.global.linking` (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)
- `att.global.facs` (@facs)
- `att.global.change` (@change)
- `att.global.responsibility` (@cert, @resp)
- `att.global.source` (@source)

**Contained by**
- `core: respStmt`

**May contain**
- `core: abbr, address, cb, date, email, foreign, gap, hi, lb, milestone, name, note, num, pb, ptr, ref, time, title`

**Derived-module-tei_tite:**
- `b`, `colShift`, `i`, `smcap`, `sub`, `sup`, `ul`

**Character data**

Note: The attribute `ref`, inherited from the class `att.canonical` may be used to indicate the kind of responsibility in a normalized form by referring directly to a standardized list of responsibility types, such as that maintained by a naming authority, for example the list maintained at [http://www.loc.gov/marc/relators/relacode.html](http://www.loc.gov/marc/relators/relacode.html) for bibliographic usage.

**Example**

```xml
<respStmt>
  <resp ref="http://id.loc.gov/vocabulary/relators/com.html">compiler</resp>
  <name>Edward Child</name>
</respStmt>
```

**Content model**

```xml
<content>
  <macroRef key="macro.phraseSeq.limited"/>
</content>
```

**Schema Declaration**

```xml
element resp
{
  att.global.attributes,
  att.datable.attributes,
  macro.phraseSeq.limited
}
```
**<respStmt>** (statement of responsibility) supplies a statement of responsibility for the intellectual content of a text, edition, recording, or series, where the specialized elements for authors, editors, etc. do not suffice or do not apply. May also be used to encode information about individuals or organizations which have played a role in the production or distribution of a bibliographic work. [3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.2. The Edition Statement 2.2.5. The Series Statement]

### Module core

Attributes

    </sequence>
  </alternate>
  <elementRef key="note" minOccurs="0" maxOccurs="unbounded"/>
</content>
```

**Schema Declaration**
element respStmt
{
    att.global.attributes,
    {
        ( ( resp+, model.nameLike.agent+ ) | ( model.nameLike.agent+, resp+ ) ),
        note*
    }
}

<row> contains one row of a table.  

Module figures
Attributes Attributes att.global ( @xml:id, @n, @xml:lang, @xml:space)
    (att.global.rendition ( @rend, @style)) (att.global.linking ( @corresp, @synch,
    @sameAs, @copyOf, @next, @prev, @exclude, @select )) (att.global.facs ( @facs))
    (att.global.change ( @change)) (att.global.responsibility ( @cert, @resp))
    (att.global.source ( @source)) att.tableDecoration ( @role, @rows, @cols)

Contained by
figures: table
May contain
figures: cell

Example

Example row

<row role="data">
    <cell role="label">Classics</cell>
    <cell role="label">Idle listless and unimproving</cell>
</row>

Content model

<content>
    <elementRef key="cell" minOccurs="1"
        maxOccurs="unbounded"/>
</content>

Schema Declaration

element row { att.global.attributes, att.tableDecoration.attributes, cell+ }

<salute> (salutation) contains a salutation or greeting prefixed to a foreword, dedicatory epistle, or other division of a text, or the salutation in the closing of a letter, preface, etc.  

Module textstructure
Attributes Attributes att.global ( @xml:id, @n, @xml:lang, @xml:space)
    (att.global.rendition ( @rend, @style)) (att.global.linking ( @corresp, @synch,
    @sameAs, @copyOf, @next, @prev, @exclude, @select )) (att.global.facs ( @facs))
    (att.global.change ( @change)) (att.global.responsibility ( @cert, @resp))
    (att.global.source ( @source)) att.written ( @hand)

Member of model.divWrapper
Example

<salute>To all courteous mindes, that will vouchsafe the readinge.</salute>
The <seg> element may be used at the encoder’s discretion to mark any segments of the text of interest for processing. One use of the element is to mark text features for which no appropriate markup is otherwise defined. Another use is to provide an identifier for some segment which is to be pointed at by some other element—i.e. to provide a target, or a part of a target, for a <ptr> or other similar element.

**Example**

```xml
<seg>When are you leaving?</seg>
<seg>Tomorrow.</seg>
```

**Example**

```xml
<s>
  <seg rend="caps" type="initial-cap">So father’s only</seg> glory was the ballfield.
</s>
```

**Example**

```xml
<seg type="preamble">
  <seg>Sigmund, <seg type="patronym">the son of Volsung</seg>, was a king in Frankish country.</seg>
  <seg>Sinfjolli was the eldest of his sons ...</seg>
  <seg>Borghild, Sigmund’s wife, had a brother ...</seg>
</seg>
```

**Content model**

```xml
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

**Schema Declaration**

```xml
element seg {
  att.global.attributes,
  att.typed.attributes,
  att.written.attributes,
  att.notated.attributes,
  macro.paraContent}
```
**<signed>** (signature) contains the closing salutation, etc., appended to a foreword, dedicatory epistle, or other division of a text. [4.2.2. Openers and Closers]

**Module textstructure**

**Attributes**

- `att.global.attributes` (`@xml:id`, `@n`, `@xml:lang`, `@xml:space`)
- `att.global.rendition` (`@rend`, `@style`)
- `att.global.linking` (`@corresp`, `@synch`, `@sameAs`, `@copyOf`, `@next`, `@prev`, `@exclude`, `@select`)

Contained by
textstructure: group

May contain
core: cb gap lb milestone note pb
derived-module-tei_tite: colShift
figures: figure
textstructure: back body front group

Note This element should not be used to represent a text which is inserted at an arbitrary point within the structure of another, for example as in an embedded or quoted narrative; the <floatingText> is provided for this purpose.

Example

```xml
<text>
  <front>
    <docTitle>
      <titlePart>Autumn Haze</titlePart>
    </docTitle>
  </front>
  <body>
    <l>Is it a dragonfly or a maple leaf?</l>
    <l>That settles softly down upon the water?</l>
  </body>
</text>
```

Example The body of a text may be replaced by a group of nested texts, as in the following schematic:

```xml
<text>
  <front>
    <!-- front matter for the whole group -->
  </front>
</text>
```
Content model

  att.global.attributes,
  att.datable.attribute.calendar,
  att.datable.w3c.attribute.when,
  att.typed.attributes,
  ( text | model.gLike | model.phrase | model.global )*
}
```

<\texttt{\texttt{title}}\texttt{\texttt{>}} contains a title for any kind of work. [3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement] [2.2.5. The Series Statement]
Module core

Attributes

\texttt{att.global (@xml:id, @n, @xml:lang, @xml:space)}
\begin{itemize}
  \item @xml:id
  \item @n
  \item @xml:lang
  \item @xml:space
\end{itemize}

\texttt{att.global.rendition (@rend, @style)}
\texttt{att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select)}
\texttt{att.global.facs (@facs)}
\texttt{att.global.change (@change)}
\texttt{att.global.responsibility (@cert, @resp)}
\texttt{att.global.source (@source)}
\texttt{att.datable (@calendar)}
\texttt{att.datable.w3c (@when, @from, @to)}

@type classifies the title according to some convenient typology.

\textit{Derived from} \texttt{att.typed}

\textit{Status} Optional

\textit{Datatype} \texttt{teidata.enumerated}

\textit{Sample values include:}

\begin{itemize}
  \item \texttt{main} main title
  \item \texttt{sub} (subordinate) subtitle, title of part
  \item \texttt{alt} (alternate) alternate title, often in another language, by which the work is also known
  \item \texttt{short} abbreviated form of title
  \item \texttt{desc} (descriptive) descriptive paraphrase of the work functioning as a title
\end{itemize}

\textit{Note} This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single \texttt{<title>} element.

@level indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

\textit{Status} Optional

\textit{Datatype} \texttt{teidata.enumerated}

\textit{Legal values are:}

\begin{itemize}
  \item \texttt{a} (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.
  \item \texttt{m} (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works
  \item \texttt{j} (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper
  \item \texttt{s} (series) the title applies to a series of otherwise distinct publications such as a collection
  \item \texttt{u} (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)
\end{itemize}

\textit{Note} The level of a title is sometimes implied by its context: for example, a title appearing directly within an \texttt{<analytic>} element is \textit{ipso facto} of level \texttt{a}, and one appearing within a \texttt{<series>} element of level \texttt{s}. For this reason, the \texttt{level} attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.
The attributes `key` and `ref`, inherited from the class `att.canonical` may be used to indicate the canonical form for the title; the former, by supplying (for example) the identifier of a record in some external library system; the latter by pointing to an XML element somewhere containing the canonical form of the title.

**Example**

```
```

**Example**

```
<title>Hardy's Tess of the D'Urbervilles: a machine readable edition</title>
```

**Example**

```
<title type="full">
<title type="main">Synthèse</title>
<title type="sub">an international journal for epistemology, methodology and history of science</title>
</title>
```

**Content model**

```
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

**Schema Declaration**

```
<element title
{
  att.global.attributes,
  att.datable.attributes,
```
ATTRIBUTE

attribute type { text }?,
attribute level { "a" | "m" | "j" | "s" | "u" }?,
macro.paraContent}

**<titlePage>** (title page) contains the title page of a text, appearing within the front or back matter. [4.6. Title Pages]

**Module** textstructure

**Attributes**

Contained by
<unclear> contains a word, phrase, or passage which cannot be transcribed with 
certainty because it is illegible or inaudible in the source. [11.3.3.1. Damage, 
Illegibility, and Supplied Text 3.4.3. Additions, Deletions, and Omissions]

Module core
Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:space)
(att.global.rendition (@rend, @style)) (att.global.linking (@corresp, @synch, 
@sameAs, @copyOf, @next, @prev, @exclude, @select)) (att.global.facs (@facs))
(att.global.change (@change)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))
@reason indicates why the material is hard to transcribe.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: illegible

inaudible
faded
background_noise
eccentric_ductus

<div>
<head>Rx</head>
<p>500 mg <unclear reason="illegible">placebo</unclear>
</p>
</div>

Note One or more words may be used to describe the reason;
usually each word will refer to a single cause.
Note  The same element is used for all cases of uncertainty in the transcription of element content, whether for written or spoken material. For other aspects of certainty, uncertainty, and reliability of tagging and transcription, see chapter 21. Certainty, Precision, and Responsibility.

The <damage>, <del>, <unclear> and <supplied> elements may be closely allied in use. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The hand attribute points to a definition of the hand concerned, as further discussed in section 11.3.2.1. Document Hands.

Example

```xml
<u> ...and then <unclear reason="background-noise">Nathalie</unclear> said ...
</u>
```

Content model

```xml
<content>
<macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

Note This class of elements can occur within paragraphs, list items, lines of verse, etc.
model.placeStateLike  groups elements which describe changing states of a place.

Module  tei
Used by  model.nameLike
Members  model.placeNamePart

model.ptrLike  groups elements used for purposes of location and reference. 3.6.
Simple Links and Cross-References

Module  tei
Used by  bibl  cit  model.limitedPhrase  model.phrase
Members  ptr  ref

model.qLike  groups elements related to highlighting which can appear either within or between chunk-level elements. 3.3. Highlighting and Quotation

Module  tei
Used by  cit  macro.phraseSeq  model.inter  sp
Members  model.quoteLike  cit  floatingText

model.quoteLike  groups elements used to directly contain quotations.

Module  tei
Used by  model.qLike
Members  cit

model.respLike  groups elements which are used to indicate intellectual or other significant responsibility, for example within a bibliographic element.

Module  tei
Used by  model.biblPart
Members  author  editor  respStmt

model.segLike  groups elements used for arbitrary segmentation. 16.3. Blocks, Segments, and Anchors 17.1. Linguistic Segment Categories

Module  tei
Used by  bibl  model.phrase
Members  seg

Note  The principles on which segmentation is carried out, and any special codes or attribute values used, should be defined explicitly in the <segmentation> element of the <encodingDesc> within the associated TEI header.

model.stageLike  groups elements containing stage directions or similar things defined by the module for performance texts. 7.3. Other Types of Performance Text

Module  tei
Stage directions are members of class *inter*: that is, they can appear between or within component-level elements.

---

**model.titlepagePart** groups elements which can occur as direct constituents of a title page, such as `<docTitle>`, `<docAuthor>`, `<docImprint>`, or `<epigraph>`. [4.6. Title Pages](#)

**Module** tei

**Used by** titlePage

**Members** argument byline docAuthor docDate docEdition docImprint docTitle epigraph graphic ornament titlePart

---

**att.ascribed.directed** provides attributes for elements representing speech or action that can be directed at a group or individual. [3.3.3. Quotation] [8.3. Elements Unique to Spoken Texts]

**Module** tei

**Members** q sp stage

**Attributes**

- `@toWhom` indicates the person, or group of people, to whom a speech act or action is directed.  
  **Status** Optional  
  **Datatype** 1–∞ occurrences of `teidata.pointer` separated by whitespace

In the following example from Mary Pix’s *The False Friend*, speeches (`<sp>`) in the body of the play are linked to `<castItem>` elements in the `<castList>` using the `toWhom` attribute, which is used to specify who the speech is directed to. Additionally, the `<stage>` includes `toWhom` to indicate the directionality of the action. `<castItem type="role">`  

```xml
<castItem type="role">Emilius.</castItem>
<castItem type="role">Lovisa</castItem>
<castItem type="role">A servant</castItem>
<!-- ... -->
<sp who="#emil" toWhom="#lov">
  <speaker>Emilius.</speaker>
  <l n="1">My love!</l>
</sp>
<sp who="#lov" toWhom="#emil">
  <speaker>Lovisa</speaker>
  <l n="2">I have no Witness of my Noble Birth</l>
  <stage who="emil" toWhom="#serv">Pointing to her Woman.</stage>
  <l n="2">But that poor helpless wretch——</l>
</sp>
```

---

143
att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times | 13.3.7. Dates and Times]

Module tei

<table>
<thead>
<tr>
<th>Members</th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>resp</td>
<td>title</td>
<td></td>
</tr>
</tbody>
</table>

Attributes Attributes att.datable.w3c (@when, @from, @to)

@calendar indicates the system or calendar to which the date represented by the content of this element belongs.

Status Optional

Datatype teidata.pointer

Schematron <sch:rule context="tei:*[@calendar]">
  <sch:assert test="string-length(.) gt 0">@calendar indicates the system or calendar to which the date represented by the content of this element belongs, but this <sch:name/> element has no textual content.</sch:assert> </sch:rule>

He was born on <date calendar="#gregorian">Feb. 22, 1732</date> (he was born on <date calendar="#julian" when="1732-02-22"> Feb. 11, 1731/32, O.S.</date>).

Note Note that the calendar attribute (unlike datingMethod defined in att.datable.custom) defines the calendar system of the date in the original material defined by the parent element, not the calendar to which the date is normalized.

This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.datable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.datable.iso and att.datable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.datable.w3c provides attributes for normalization of elements that contain datable events conforming to the W3C XML Schema Part 2: Datatypes Second Edition. [3.5.4. Dates and Times | 13.3.7. Dates and Times]

Module tei

<table>
<thead>
<tr>
<th>Members</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>att.datable</td>
<td>name</td>
<td>resp</td>
</tr>
</tbody>
</table>

Attributes Attributes

@when supplies the value of the date or time in a standard form, e.g. yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

Examples of W3C date, time, and date & time formats. <p>
  <date when="1945-10-24">24 Oct 45</date>
  <date when="1996-09-24T07:25:00Z">September 24th, 1996 at 3:25 in the morning</date>
This list begins in the year 1632, more precisely on Trinity Sunday, i.e. the Sunday after Pentecost, in that year the
<date calendar="#julian" when="1632-06-06">27th of May (old style)</date>.

<opener>
<dateline>
<placeName>Dorchester, Village</placeName>
<date when="1828-03-02">March 2d, 1828.</date>
</dateline>
<salute>To Mrs. Cornell</salute> Sunday
<time when="12:00:00">noon</time>
</opener>

@from indicates the starting point of the period in standard form, e.g. yyyy-mm-dd.
Status Optional
Datatype teidata.temporal.w3c
@to indicates the ending point of the period in standard form, e.g. yyyy-mm-dd.
Status Optional
Datatype teidata.temporal.w3c

Schematron <sch:rule context="tei:*[@when]">
    <sch:report test="@[notBefore|notAfter|from|to]" role="nonfatal">The @when attribute cannot be used with any other att.datable.w3c attributes.</sch:report>
</sch:rule>

Schematron <sch:rule context="tei:*[@from]">
    <sch:report test="notBefore" role="nonfatal">The @from and @notBefore attributes cannot be used together.</sch:report>
</sch:rule>

Schematron <sch:rule context="tei:*[@to]">
    <sch:report test="notAfter" role="nonfatal">The @to and @notAfter attributes cannot be used together.</sch:report>
</sch:rule>

Example
<date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date>

Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by XML Schema Part 2: Datatypes Second Edition, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is yyyy-mm-dd, but yyyy, --mm, --dd, yyyy-mm, or --mm-dd may also be used. For the time part, the form hh:mm:ss is used.

Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.
att.declarable provides attributes for those elements in the TEI header which may be
independently selected by means of the special purpose decls attribute. [15.3.]

Assessing Contextual Information with a Text

Module tei
Members bibl listBibl
Attributes Attributes

@default indicates whether or not this element is selected by default when its
parent is selected.

Status Optional

Datatype teidata.truthValue

Legal values are: true This element is selected if its parent is selected

false This element can only be selected explicitly, unless it is the
only one of its kind, in which case it is selected if its parent is
selected. [Default]

The rules governing the association of declarable elements with individual parts of a
TEI text are fully defined in chapter 15.3. Assessing Contextual Information with
a Text. Only one element of a particular type may have a default attribute with a
value of true.

att.docStatus provides attributes for use on metadata elements describing the status of
a document.

Module tei

Members bibl

Attributes Attributes

@status describes the status of a document either currently or, when associated
with a dated element, at the time indicated.

Status Optional

Datatype teidata.enumerated

Sample values include: approved

candidate
cleared
deprecated
draft [Default]
embargoed
expired
frozen
galley
proposed
published
recommendation
submitted
unfinished
withdrawn

Example
att.fragmentable provides an attribute for representing fragmentation of a structural element, typically as a consequence of some overlapping hierarchy.

Module tei

Attributes

@part specifies whether or not its parent element is fragmented in some way, typically by some other overlapping structure: for example a speech which is divided between two or more verse stanzas, a paragraph which is split across a page division, a verse line which is divided between two speakers.

Status Optional

Datatype teidata.enumerated

Legal values are: Y (yes) the element is fragmented in some unspecified respect

N (no) the element is not fragmented, or no claim is made as to its completeness [Default]

I (initial) this is the initial part of a fragmented element

M (medial) this is a medial part of a fragmented element

F (final) this is the final part of a fragmented element

Note The values I, M, or F should be used only where it is clear how the element may be be reconstituted.

att.global provides attributes common to all elements in the TEI encoding scheme.

[1.3.1.1. Global Attributes]

Module tei

Attributes att.global.rendition (@rend, @style) att.global.linking (@corresp, @synch, @sameAs, @copyOf, @next, @prev, @exclude, @select) att.global.facs (@facs) att.global.change (@change) att.global.responsibility (@cert, @resp) att.global.source (@source)
@xml:id (identifier) provides a unique identifier for the element bearing the attribute.

*Status* Optional

*Datatype* ID

*Note* The `xml:id` attribute may be used to specify a canonical reference for an element; see section §3.10. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.

*Status* Optional

*Datatype* teidata.text

*Note* The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.

*Status* Optional

*Datatype* teidata.language

*Note* The `xml:lang` value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify `xml:lang` at the highest appropriate level, noticing that a different default may be needed for the `teiHeader` from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.

The authoritative list of registered language subtags is maintained by IANA and is available at http://www.iana.org/assignments/language-subtag-registry. For a good general overview of the construction of language tags, see http://www.w3.org/International/articles/language-tags/, and for a practical step-by-step guide, see https://www.w3.org/International/questions/qa-choosing-language-tags.en.php. The value used must conform with BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a <language> element with a matching value for its `ident` attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@xml:space signals an intention about how white space should be managed by applications.

*Status* Optional

*Datatype* teidata.enumerated

*Legal values are:* default signals that the application’s default white-space processing modes are acceptable
**preserve** indicates the intent that applications preserve all white space.

*Note* The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle `xml:space` correctly.

**att.global.change** supplies the *change* attribute, allowing its member elements to specify one or more states or revision campaigns with which they are associated.

**Module** transcr

**Members**

[abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item l label li lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear]

**Attributes**

@change points to one or more `<change>` elements documenting a state or revision campaign to which the element bearing this attribute and its children have been assigned by the encoder.

**Status** Optional

**Datatype** `1–∞ occurrences of teidata.pointer` separated by whitespace

**att.global.facs** provides an attribute used to express correspondence between an element containing transcribed text and all or part of an image representing that text. [11.1. Digital Facsimiles]

**Module** transcr

**Members**

[abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item l label li lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear]

**Attributes**

@facs (facsimile) points to all or part of an image which corresponds with the content of the element.

**Status** Optional

**Datatype** `1–∞ occurrences of teidata.pointer` separated by whitespace

**att.global/linking** provides a set of attributes for hypertextual linking. [16. Linking, Segmentation, and Alignment]

**Module** linking

**Members**

[abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7]
Attributes

`@corresp` (corresponds) points to elements that correspond to the current element in some way.

Status Optional

Datatype 1–∞ occurrences of `teidata.pointer` separated by whitespace

```xml
<group>
  <text xml:id="t1-gl-t1"
       xml:lang="mi">
    <body xml:id="t1-gl-t1-body1">
      <div type="chapter">
        <head>He Whakamaramatanga mo te Ture Hoko, Rihi hoki, i nga Whenua Maori, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
  <text xml:id="t1-gl-t2"
       xml:lang="en">
    <body xml:id="t1-gl-t2-body1" corresp="#t1-gl-t1-body1">
      <div type="chapter">
        <head>An Act to regulate the Sale, Letting, and Disposal of Native Lands, 1876.</head>
        <p>…</p>
      </div>
    </body>
  </text>
</group>
```

In this example a `<group>` contains two `<text>`s, each containing the same document in a different language. The correspondence is indicated using `corresp`. The language is indicated using `xml:lang`, whose value is inherited; both the tag with the `corresp` and the tag pointed to by the `corresp` inherit the value from their immediate parent.

<!-- In a placeography called "places.xml" -->
```xml
<place xml:id="LOND1"
       corresp="people.xml#LOND2 people.xml#GENI1">
  <placeName>London</placeName>
  <desc>The city of London...</desc>
</place>
<!-- In a literary personography called "people.xml" -->
```xml
<person xml:id="LOND2"
        corresp="places.xml#LOND1 #GENI1">
  <persName type="lit">London</persName>
  <note>
    <p>Allegorical character representing the city of London</p>
  </note>
</person>
```xml
<person xml:id="GENI1"
        corresp="places.xml#LOND1 #LOND2">
  <persName type="lit">London’s Genius</persName>
  <note>
    <p>Personification of London’s genius. Appears as an allegorical character in mayoral shows.</p>
  </note>
</person>
```
In this example, a <place> element containing information about the city of London is linked with two <person> elements in a literary personography. This correspondence represents a slightly looser relationship than the one in the preceding example; there is no sense in which an allegorical character could be substituted for the physical city, or vice versa, but there is obviously a correspondence between them.

@sync (synchronous) points to elements that are synchronous with the current element.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

@sameAs points to an element that is the same as the current element.

Status Optional

Datatype teidata.pointer

Note Any content of the current element should be ignored. Its true content is that of the element being pointed at.

@copyOf points to an element of which the current element is a copy.

Status Optional

Datatype teidata.pointer

Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@next points to the next element of a virtual aggregate of which the current element is part.

Status Optional

Datatype teidata.pointer

Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@prev (previous) points to the previous element of a virtual aggregate of which the current element is part.

Status Optional

Datatype teidata.pointer

Note It is recommended that the element indicated be of the same type as the element bearing this attribute.

@exclude points to elements that are in exclusive alternation with the current element.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

@select selects one or more alternants; if one alternant is selected, the ambiguity or uncertainty is marked as resolved. If more than one alternant is selected, the degree of ambiguity or uncertainty is marked as reduced by the number of alternants not selected.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note This attribute should be placed on an element which is superordinate to all of the alternants from which the selection is being made.
att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.3. Rendition Indicators]

Module tei

<table>
<thead>
<tr>
<th>Members</th>
<th>att.global</th>
<th>abbr</th>
<th>addrLine</th>
<th>address</th>
<th>argument</th>

<td></td>
<td>stage</td>
<td>sub</td>
<td>sup</td>
<td>table</td>
<td>text</td>
<td>time</td>
<td>title</td>
<td>titlePage</td>
<td>titlePart</td>
<td>trailer</td>
</tr>
</tbody>
</table>

Attributes

@rend (rendition) indicates how the element in question was rendered or presented in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.word separated by whitespace

```
<head rend="align(center) case(allcaps)">
  <lb>To The <lb/>Duchesse <lb/>of <lb/>Newcastle,
  <lb/>On Her <lb/>
  <hi rend="case(mixed)">New Blazing-World</hi>.
</head>
```

Note These Guidelines make no binding recommendations for the values of the rend attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially useful conventions are noted from time to time at appropriate points in the Guidelines. The values of the rend attribute are a set of sequence-indeterminate individual tokens separated by whitespace.

@style contains an expression in some formal style definition language which defines the rendering or presentation used for this element in the source text

Status Optional

Datatype teidata.text

```
<head style="text-align: center; font-variant: small-caps">
  <lb>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On Her
  <lb/>
  <hi style="font-variant: normal">New Blazing-World</hi>.
</head>
```

Note Unlike the attribute values of rend, which uses whitespace as a separator, the style attribute may contain whitespace. This attribute is intended for recording inline stylistic information concerning the source, not any particular output.

The formal language in which values for this attribute are expressed may be specified using the <styleDefDecl> element in the TEI header.

If style and rendition are both present on an element, then style overrides or complements rendition. style should not be used in conjunction with rend, because the latter does not employ a formal style definition language.

att.global.responsibility provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the
degree of certainty associated with it. [3.1.1.4. Sources, certainty, and responsibility 3.4. Simple Editorial Changes [11.3.2.2. Hand, Responsibility, and Certainty Attributes 17.3. Spans and Interpretations] [3.1.1. Linking Names and Their Referrers]

Module tei

Members att.global abbr add addrLine address argument author b back bibl body byline ch cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front g gap graphic group handShift head hi item l label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref resp respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.

**Status** Optional

**Datatype** teidata.probCert

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.

**Status** Optional

**Datatype** 1–∞ occurrences of teidata.pointer separated by whitespace

**Note** To reduce the ambiguity of a resp pointing directly to a person or organization, we recommend that resp be used to point not to an agent (<person> or <org>) but to a <respStmt>, <author>, <editor> or similar element which clarifies the exact role played by the agent. Pointing to multiple <respStmt>s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).

**Example**

Blessed are the

```xml
<choice>
  <sic>cheesemakers</sic>
  <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.
```

**Example**

```
<!-- in the <text> ... --><lg>
<!-- ... -->
<lg>Punkes, Panders, base extortionizing
 sla<choice>
  <sic>n</sic>
  <corr resp="#JENS1_transcriber">u</corr>
</choice>es,<l/>
<!-- ... -->
</lg>
<!-- in the <teiHeader> ... -->
<!-- ... -->
<respStmt xml:id="JENS1_transcriber">
  <resp when="2014">Transcriber</resp>
  <name>Janelle Jenstad</name>
</respStmt>```
att.global.source provides an attribute used by elements to point to an external source. [1.3.1.1.4. Sources, certainty, and responsibility 3.3.3. Quotation 8.3.4. Writing]

Module: tei

Members: att.global abbr add addrLine address argument author b back bibl body byline cb cell closer colShift date dateline del desc div1 div2 div3 div4 div5 div6 div7 docAuthor docDate docEdition docImprint docTitle editor email epigraph figure floatingText foreign formula front graphic group handShift head hi i item l label lb lg list listBibl milestone name note num opener ornament p pb postscript ptr pubPlace publisher q ref respStmt row salute seg signed smcap sp speaker stage sub sup table text time title titlePage titlePart trailer ul unclear

Attributes

@source specifies the source from which some aspect of this element is drawn.

Status: Optional

Datatype: 1–∞ occurrences of teidata.pointer separated by whitespace

Note: The source attribute points to an external source. When used on elements describing schema components such as <schemaSpec> or <moduleRef> it identifies the source from which declarations for the components of the object being defined may be obtained.

On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI, for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a <prefixDef>.

If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.

Example

```xml
<p>
<!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>) tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and should be a contested term.</quote> <!-- ... -->
</p>
```

Example

```xml
<p>
<!-- ... --> <quote source="#chicago_15_ed">Grammatical theories are in flux, and the more we learn, the less we seem to know.</quote> <!-- ... -->
</p>
```

```xml
<bibl xml:id="chicago_15_ed">
```
att.milestoneUnit provides an attribute to indicate the type of section which is changing at a specific milestone. [3.10.3. Milestone Elements 2.3.6.3. Milestone Method 2.3.6. The Reference System Declaration]

Module core
Members milestone
Attributes Attributes

@unit provides a conventional name for the kind of section changing at this milestone.

Status Required
Datatype teidata.enumerated

Suggested values include: page physical page breaks (synonymous with the <pb> element).

column column breaks.
line line breaks (synonymous with the <lb> element).
book any units termed book, liber, etc.
poem individual poems in a collection.
canto cantos or other major sections of a poem.
speaker changes of speaker or narrator.
stanza stanzas within a poem, book, or canto.
act acts within a play.
scene scenes within a play or act.
section sections of any kind.
absent passages not present in the reference edition.
unnumbered passages present in the text, but not to be included as part of the reference.

Example

<milestone n="23" ed="La" unit="Dreissiger"/>
... <milestone n="24"
Formal Specification

Note: If the milestone marks the beginning of a piece of text not present in the reference edition, the special value absent may be used as the value of unit. The normal interpretation is that the reference edition does not contain the text which follows, until the next <milestone> tag for the edition in question is encountered. In addition to the values suggested, other terms may be appropriate (e.g. Stephanus for the Stephanus numbers in Plato).

**att.notated** provides an attribute to indicate any specialised notation used for element content.

**att.personal** (attributes for components of names usually, but not necessarily, personal names) common attributes for those elements which form part of a name usually, but not necessarily, a personal name. [13.2.1. Personal Names]

**att.pointing** provides a set of attributes used by all elements which point to other elements by means of one or more URI references. [1.3.1.1.2. Language Indicators 3.6. Simple Links and Cross-References]
**Members** note ptr ref

**Attributes** Attributes

@targetLang specifies the language of the content to be found at the destination referenced by target, using a language tag generated according to BCP 47.

**Status** Optional

**Datatype** teidata.language

**Schematron**

```
<sch:rule context="tei:*[not(self::tei:schemaSpec)][@targetLang]">
  <sch:assert test="@target">@targetLang should only be used on <sch:name/> if @target is specified.</sch:assert>
</sch:rule>
```

In the example above, the `<linkGrp>` combines pointers at parallel fragments of the *Universal Declaration of Human Rights*: one of them is in Polish, the other in Swahili.

**Note** The value must conform to BCP 47. If the value is a private use code (i.e., starts with x- or contains -x-), a `<language>` element with a matching value for its ident attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

@target specifies the destination of the reference by supplying one or more URI References.

**Status** Optional

**Datatype** 1–∞ occurrences of teidata.pointer separated by whitespace

**Note** One or more syntactically valid URI references, separated by whitespace. Because whitespace is used to separate URIs, no whitespace is permitted inside a single URI. If a whitespace character is required in a URI, it should be escaped with the normal mechanism, e.g. TEI%20Consortium.

---

**att.resourced** provides attributes by which a resource (such as an externally held media file) may be located.

**Module** tei

**Members** graphic

**Attributes** Attributes

@url (uniform resource locator) specifies the URL from which the media concerned may be obtained.

**Status** Required

**Datatype** teidata.pointer
att.sortable provides attributes for elements in lists or groups that are sortable, but whose sorting key cannot be derived mechanically from the element content. Dictionary Body and Overall Structure

Module tei
Members bibl item list listBibl
Attributes Attributes

@sortKey supplies the sort key for this element in an index, list or group which contains it.

Status Optional
Datatype teidata.word

David’s other principal backer, Josiah ha-Kohen &lt;index indexName="NAMES”&gt;
&lt;term sortKey="Azarya_Josiah_Kohen”&gt;Josiah ha-Kohen b. Azarya&lt;/term&gt;
&lt;/index&gt; b. Azarya, son of one of the last gaons of Sura was David’s own first cousin.

Note The sort key is used to determine the sequence and grouping of entries in an index. It provides a sequence of characters which, when sorted with the other values, will produce the desired order; specifics of sort key construction are application-dependent.

Dictionary order often differs from the collation sequence of machine-readable character sets; in English-language dictionaries, an entry for 4-H will often appear alphabetized under fourh, and McCoy may be alphabetized under maccy, while A1, A4, and A5 may all appear in numeric order alphabetized between a- and AA. The sort key is required if the orthography of the dictionary entry does not suffice to determine its location.

att.tableDecoration provides attributes used to decorate rows or cells of a table.

Module figures
Members cell row
Attributes Attributes

@role indicates the kind of information held in this cell or in each cell of this row.

Status Optional
Datatype teidata.enumerated

Suggested values include: label labelling or descriptive information only.

data data values. [Default]

Note When this attribute is specified on a row, its value is the default for all cells in this row. When specified on a cell, its value overrides any default specified by the role attribute of the parent &lt;row&gt; element.

@rows indicates the number of rows occupied by this cell or row.

Status Optional
Datatype teidata.count
Default 1

Note A value greater than one indicates that this cell spans several
att.timed provides attributes common to those elements which have a duration in time, expressed either absolutely or by reference to an alignment map. [8.3.5. Temporal Information]

Module tei

Attributes Attributes

@start indicates the location within a temporal alignment at which this element begins.

Status Optional

Datatype teidata.pointer

Note If no value is supplied, the element is assumed to follow the immediately preceding element at the same hierarchic level.

@end indicates the location within a temporal alignment at which this element ends.

Status Optional

Datatype teidata.pointer

Note If no value is supplied, the element is assumed to precede the immediately following element at the same hierarchic level.

att.transcriptional provides attributes specific to elements encoding authorial or scribal intervention in a text when transcribing manuscript or similar sources. [11.3.1.4. Additions and Deletions]

Module tei

Members add del

Attributes Attributes att.written (@hand)

@status indicates the effect of the intervention, for example in the case of a deletion, strikeouts which include too much or too little text, or in the case of an addition, an insertion which duplicates some of the text already present.

Status Optional

Datatype teidata.enumerated

Sample values include: duplicate all of the text indicated as an addition duplicates some text that is in the original, whether the duplication is word-for-word or less exact.

duplicate-partial part of the text indicated as an addition duplicates some text that is in the original
excessStart some text at the beginning of the deletion is marked as deleted even though it clearly should not be deleted.
excessEnd some text at the end of the deletion is marked as deleted even though it clearly should not be deleted.
shortStart some text at the beginning of the deletion is not marked as deleted even though it clearly should be.
shortEnd some text at the end of the deletion is not marked as deleted even though it clearly should be.
partial some text in the deletion is not marked as deleted even though it clearly should be.
unremarkable the deletion is not faulty. [Default]

Note Status information on each deletion is needed rather rarely except in critical editions from authorial manuscripts; status information on additions is even less common.
Marking a deletion or addition as faulty is inescapably an interpretive act; the usual test applied in practice is the linguistic acceptability of the text with and without the letters or words in question.

@cause documents the presumed cause for the intervention.

Status Optional
Datatype teidata.enumerated

@seq (sequence) assigns a sequence number related to the order in which the encoded features carrying this attribute are believed to have occurred.
Status Optional
Datatype teidata.count

Module tei

Members add bibl cb date del div1 div2 div3 div4 div5 div6 div7 figure floatingText g group head lb lg listBibl milestone name note pb ptr ref seg table text time trailer

Attributes Attributes
@type characterizes the element in some sense, using any convenient classification scheme or typology.
Status Optional
Datatype teidata.enumerated

<div type="verse">
<head>Night in Tarras</head>
<lg type="stanza">

At evening tramping on the hot white road

A wind sprang up from nowhere as the sky

---

**Note** The `type` attribute is present on a number of elements, not all of which are members of `att.typed`, usually because these elements restrict the possible values for the attribute in a specific way.

**Schematron**

The `<sch:name/>` element should not be categorized in detail with `@subtype` unless also categorized in general with `@type`.

**Note** When appropriate, values from an established typology should be used. Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the `<valList>` element in the project-specific schema description, as described in 23.3.1.4. Modification of Attribute and Attribute Value Lists.

---

The `att.written` attribute provides an attribute to indicate the hand in which the content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

**Module** tei

**Members** `att.transcriptional add del closer figure head hi label note opener p postscript salute seg signed text`

**Attributes**

`@hand` points to a `<handNote>` element describing the hand considered responsible for the content of the element concerned.

**Status** Optional

**Datatype** teidata.pointer

### B.4 Macros

**macro.limitedContent** (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

**Module** tei

**Used by** desc

**Content model**

```xml
<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.limitedPhrase"/>
    <classRef key="model.inter"/>
  </alternate>
</content>
```

**Declaration**
macro.limitedContent = ( text | model.limitedPhrase | model.inter )*

macro.paraContent (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

Module tei
Used by ab add del docEdition hi ip p ref salute seg signed smcap sub sup title titlePart
ui unclear

Content model

<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.global"/>
    <elementRef key="lg"/>
    <classRef key="model.lLike"/>
  </alternate>
</content>

Declaration

macro.paraContent =
  ( text
    | model.gLike | model.phrase | model.inter | model.global | lg | model.lLike
)*

macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. Standard Content Models]

Module tei
Used by abbr addrLine author docAuthor docDate editor email foreign label name num
pubPlace publisher speaker

Content model

<content>
  <alternate minOccurs="0" maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.qLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.global"/>
  </alternate>
</content>

Declaration

macro.phraseSeq =
  ( text | model.gLike | model.qLike | model.phrase | model.global )*
**macro.phraseSeq.limited** (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

```
Module: tei
Used by: resp

Content model

```<content>
<alternate minOccurs="0" maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.limitedPhrase"/>
  <classRef key="model.global"/>
</alternate>
</content>
```

Declaration

```macro.phraseSeq.limited = ( text | model.limitedPhrase | model.global )*```  

**macro.specialPara** ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

```
Module: tei
Used by: cell item note stage

Content model

```<content>
<alternate minOccurs="0" maxOccurs="unbounded">
  <textNode/>
  <classRef key="model.gLike"/>
  <classRef key="model.phrase"/>
  <classRef key="model.inter"/>
  <classRef key="model.divPart"/>
  <classRef key="model.global"/>
</alternate>
</content>
```

Declaration

```macro.specialPara =
( text
  | model.gLike  | model.phrase  | model.inter  | model.divPart
  | model.global)*```  

### B.5 Datatypes

**teidata.certainty** defines the range of attribute values expressing a degree of certainty.
Module tei
Used by teidata.probCert

Content model

```
<content>
  <valList type="closed">
    <valItem ident="high" />
    <valItem ident="medium" />
    <valItem ident="low" />
    <valItem ident="unknown" />
  </valList>
</content>
```

Declaration

```
teidata.certainty = "high" | "medium" | "low" | "unknown"
```

Note  Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

teidata.count  defines the range of attribute values used for a non-negative integer value used as a count.

Module tei
Used by

- Element: colShift/@cols
- Element: table/@rows
- Element: table/@cols

Content model

```
<content>
  <dataRef name="nonNegativeInteger"/>
</content>
```

Declaration

```
teidata.count = xsd:nonNegativeInteger
```

Note  Any positive integer value or zero is permitted

teidata.duration.iso  defines the range of attribute values available for representation of a duration in time using ISO 8601 standard formats

Module tei
Used by

Content model

```
<content>
  <dataRef name="token"
    restriction="[0-9.,DHMPRSTWYZ/:+-]+"/>
</content>
```

Declaration
teidata.duration.iso = token { pattern = "[0-9.,DHMPRSTWYZ/:+-]+" }

Example

<time dur-iso="PT0,75H">three-quarters of an hour</time>

Example

<date dur-iso="P1,5D">a day and a half</date>

Example

<date dur-iso="P14D">a fortnight</date>

Example

<time dur-iso="PT0.02S">20 ms</time>

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except for the last, which may have a decimal component (using either . or , as the decimal point; the latter is preferred). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair. For complete details, see ISO 8601 Data elements and interchange formats — Information interchange — Representation of dates and times.

teidata.duration.w3c defines the range of attribute values available for representation of a duration in time using W3C datatypes.

Module tei

Used by

Content model

<content> <dataRef name="duration"/></content>

Declaration

tei.data.duration.w3c = xsd:duration

Example

<time dur="PT45M">forty-five minutes</time>

Example

<date dur="P1DT12H">a day and a half</date>

Example

<date dur="P7D">a week</date>

Example

<time dur="PT0.02S">20 ms</time>

Note A duration is expressed as a sequence of number-letter pairs, preceded by the letter P; the letter gives the unit and may be Y (year), M (month), D (day), H (hour), M (minute), or S (second), in that order. The numbers are all unsigned integers, except
for the S number, which may have a decimal component (using . as the decimal point). If any number is 0, then that number-letter pair may be omitted. If any of the H (hour), M (minute), or S (second) number-letter pairs are present, then the separator T must precede the first time number-letter pair.
For complete details, see the W3C specification.

**teidata.enumerated** defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

*Module* tei
*Used by* Element:

- `desc/@type`
- `gap/@reason`
- `list/@type`
- `num/@type`
- `g/@type`
- `title/@type`
- `title/@level`
- `titlePage/@type`
- `titlePart/@type`
- `unclear/@reason`

*Content model* `<content> <dataRef key="teidata.word"/></content>`

*Declaration* `teidata.enumerated = teidata.word`

*Note* Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a `<valList>` element.

**teidata.language** defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]

*Module* tei
*Used by*

*Content model* 

```xml
<content>
  <alternate>
    <dataRef name="language"/>
    <valList>
      <valItem ident=""/>
    </valList>
  </alternate>
</content>
```

*Declaration* `teidata.language = xsd:language | ( "" )`

166
Note The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A language tag, per BCP 47, is assembled from a sequence of components or subtags separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

language The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at http://www.iana.org/assignments/language-subtag-registry. It is recommended that this code be written in lower case.

script The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at http://unicode.org/iso15924/iso15924-codes.html. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

region Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is recommended they be written in upper case; the list of codes can be searched or browsed at https://www.iso.org/obp/ui/#search/code/. The latter consist of 3 digits; the list of codes can be found at http://unstats.un.org/unsd/methods/m49/m49.htm.

variant An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.

extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

private use An extension that uses the initial subtag of the single letter x (i.e., starts with x-) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding <language> element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with x-, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding <language> element in the TEI header.

Examples include
teidata.numeric defines the range of attribute values used for numeric values.

Module tei
Used by
Content model

```xml
<content>
  <alternate>
    <dataRef name="double"/>
    <dataRef name="token"
      restriction="(-?\d+/\d+)"/>
    <dataRef name="decimal"/>
  </alternate>
</content>
```

Declaration

```xml
teidata.numeric =
  xsd:double | token { pattern = "(-\d+/\d+)" } | xsd:decimal
```

Note Any numeric value, represented as a decimal number, in floating point format, or as a ratio.

To represent a floating point number, expressed in scientific notation, E notation, a variant of exponential notation, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.

Module tei
Used by
Content model
teidata.point

declaration

teidata.point = token { pattern = "(\-?[0-9]+\.[0-9]*)+\.[0-9]*" }  

Note
These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

teidata.point  defines the data type used to express a point in cartesian space.

Module  tei

Used by

Content model

declaration

teidata.point = token { pattern = "(\-?[0-9]+\.[0-9]*)+\.[0-9]*" }  

Schematron
Several standards bodies, including NIST in the USA, strongly recommend against ending the representation of a number with a decimal point. So instead of 3.0 use either 3 or 3.0. <sch:rule context="*[@points]"> <sch:report test="matches( @points, '\\([0-9]+.$\)')">It is considered poor practice to end a number with a decimal point; as of 2019-02-25 TEI will consider this @points attribute of <sch:name/> invalid</sch:report> </sch:rule>

Example
Note A point is defined by two numeric values, which should be expressed as decimal numbers.
Currently, this datatype permits either of the two numeric values to end in a decimal point. This practice is deprecated, and as of 2019-02-25 this datatype will no longer permit a number to end in a decimal point. E.g., both 0.0,84.2 and 0.84 are allowed, but 0.,84. will not be.

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei
Used by Element:
  • handShift/@new

Content model
<content> <dataRef name="anyURI"/></content>

Declaration
  teidata.pointer = xsd:anyURI

Note The range of syntactically valid values is defined by RFC 3986 Uniform Resource Identifier (URI): Generic Syntax. Note that the values themselves are encoded using RFC 3987 Internationalized Resource Identifiers (IRIs) mapping to URIs. For example, https://secure.wikimedia.org/wikipedia/en/wiki/% is encoded as https://secure.wikimedia.org/wikipedia/en/wiki/%25 while http://موقع.وزارة-الاتصالات.مصر is encoded as http://xn--4gbrim.xn----rmckbbajlc6dj7bxne2c.xn--wgbh1c/

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

Module tei
Used by

Content model
<content>
<alternate>
  <dataRef key="teidata.probability"/>
  <dataRef key="teidata.certainty"/>
</alternate>
</content>

Declaration
  teidata.probCert = teidata.probability | teidata.certainty
teidata.probability defines the range of attribute values expressing a probability.

Module tei
Used by teidata.probCert
Content model
<content> <dataRef name="double"/></content>

Declaration
\begin{footnotesize}
etidata.probability = xsd:double\end{footnotesize}

Note Probability is expressed as a real number between 0 and 1; 0 representing certainly false and 1 representing certainly true.

**teidata.temporal.w3c** defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C XML Schema Part 2: Datatypes Second Edition specification.

Module tei
Used by Element:
• docDate/@when

Content model

\begin{footnotesize}
<content>
<alternate>
<dataRef name="date"/>
<dataRef name="gYear"/>
<dataRef name="gMonth"/>
<dataRef name="gDay"/>
<dataRef name="gYearMonth"/>
<dataRef name="gMonthDay"/>
<dataRef name="time"/>
<dataRef name="dateTime"/>
</alternate>
</content>
\end{footnotesize}

Declaration

\begin{footnotesize}
teidata.temporal.w3c =
xsd:date
| xsd:gYear
| xsd:gMonth
| xsd:gDay
| xsd:gYearMonth
| xsd:gMonthDay
| xsd:time
| xsd:dateTime
\end{footnotesize}

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

**teidata.text** defines the range of attribute values used to express some kind of identifying string as a single sequence of unicode characters possibly including whitespace.

Module tei
B FORMAL SPECIFICATION

Used by
Content model
<content> <dataRef name="string"/></content>

Declaration
```
teidata.text = string
```

Note Attributes using this datatype must contain a single token in which whitespace and other punctuation characters are permitted.

teidata.truthValue defines the range of attribute values used to express a truth value.
Module tei
Used by
Content model
<content> <dataRef name="boolean"/></content>

Declaration
```
teidata.truthValue = xsd:boolean
```

Note The possible values of this datatype are 1 or true, or 0 or false.
This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: data.xTruthValue.

teidata.versionNumber defines the range of attribute values used for version numbers.
Module tei
Used by
Content model
```
<content>
  <dataRef name="token"
    restriction="[\d]+[a-z]*[\d]*\.[\d]+[a-z]*[\d]*{0,3}"/>
</content>
```

Declaration
```
teidata.versionNumber =
  token { pattern = "[\d]+[a-z]*[\d]*\.[\d]+[a-z]*[\d]*{0,3}" } 
```

teidata.word defines the range of attribute values expressed as a single word or token.
Module tei
Used by
Content model
```
<content>
  <dataRef name="token"
    restriction="\p{L}|\p{N}|\p{P}|\p{S}"/>
</content>
```

172
teidata.xpath defines attribute values which contain an XPath expression.

Module tei

Used by

Content model `<content> <textNode/></content>`

Declaration `teidata.xpath = text`

Note Any XPath expression using the syntax defined in XSLT2.

When writing programs that evaluate XPath expressions, programmers should be mindful of the possibility of malicious code injection attacks. For further information about XPath injection attacks, see the article at OWASP.

C Acknowledgments

The TEI Tite is simply a synthesis of work done at the

- University of Michigan Digital Library Production Service,
- University of Virginia Digital Library Production Service,
- and the California Digital Library

and represented in their documents

- Minimum standards for text capture,
- Text Encoding Guidelines for Keyboarding Vendors,
- and CDL TEI Base Encoding Guidelines,

respectively. Many thanks to the institutions and individuals responsible for sharing their experience and expertise for the benefit of the TEI community at large.

Also, thank you to members of the TEI Special Interest Group on Libraries who provided very valuable corrections and suggestions.
