

Journal of the Text-Encoding Initiative Article Schema

Schema and guidelines for encoding an article for the journal

Ron Van den Branden Martin Holmes 2014

1 Introduction

This document introduces and documents the content and use of the schemas provided by the *Journal of the Text Encoding Initiative*, as part of the TEI P5 distribution, for the use of authors who want to submit their articles to the journal in TEI. The schema described in this document is highly constrained and restrictive, consisting only of some 80 elements, compared with the complete TEI schema which contains nearly six hundred. In addition to general structural constraints, the ODD file also embeds fine-grained Schematron rules, severely limiting your options as you encode your file.

It is very likely that, as an experienced and confident TEI encoder with a broad knowledge of the TEI schema, you will find this at least a little frustrating. Where the TEI typically provides several ways of encoding the same phenomenon, we usually support only one. Where larger TEI schemas will allow you to describe rendering features (`<hi rend="italic">`) we do not allow that; we force you to choose a conceptual tag such as `<emph>` or `<title level="j">`.

The reasons for this are fairly obvious. From the XML document you submit, we need to generate a range of different outputs—ODT for reviewers and copyeditors to read and annotate, OpenEdition XML for submission to the revues.org publication engine that supports the journal website, and an accompanying PDF version. We must enforce a degree of conformity across all submissions, not only in order to maintain consistency when we publish, but also to ensure that contributions are assessed by reviewers in as fair a manner as possible, without possible influences due to divergence from the expected style rules or formatting conventions.

However, this constraint and conformity has advantages for you too, as an author. Our schemas will enforce a number of constraints which, we believe, may assist you in improving the quality of your article; these are a few of them:

- All quotations should be linked to references in the text.
- All references must be linked to bibliography items.
- All bibliography items must be cited somewhere in the text.
- All text styles such as italicization or quotation marks appear as a result of conceptual tags.

In what follows, we aim to provide a readable guide to encoding your article (or perhaps even composing it) according to the journal schemas, beginning with the template we provide, and viewing your results as you work through the use of CSS (in Author Mode in Oxygen) or by transforming it into ODT for examination in your word-processor, or to PDF.

This document is a work-in-progress (always), and we welcome your feedback at either mholmes@uvic.ca (Martin Holmes) or ron.vandenbranden@kantl.be (Ron Van den Branden).

2 Encoding for jTEI in Oxygen

2.1 Using the Template

Starting with version 16.2, the default distribution of Oxygen should include the jTEI components as part of its built-in TEI P5 framework. If you are using an older version of Oxygen, you can subscribe to the TEI-built version of the framework, by following these instructions.

In Oxygen, you can start a new article based on the jTEI template by selecting **File → New**, and selecting **JTEI Article [TEI P5]** under **Framework templates → TEI P5**.

You will see that the root `<TEI>` element in the new file has an attribute `rend=jTEI`. This tells Oxygen that it's a jTEI file, so that it can apply standard jTEI rendering and validation scenarios to it. If you don't want to keep this attribute value, you can achieve the same effect by saving the file with a filename matching this format: `jtei-*-source.xml` (where the asterisk stands for anything you like); Oxygen will also recognize files with names in this format as jTEI files.

Figure 1: Selecting the jTEI article template in Oxygen.

2.2 Testing Your Document

The Oxygen framework provides two output rendering scenarios, which allow you to transform your jTEI article to the ODT and PDF formats. Open the ODT file you create in a recent version of LibreOffice or OpenOffice; Microsoft Office does not support the current ODT specification. The PDF file can be viewed in a PDF viewer such as Adobe Reader. If you see any problems with the rendering, don't worry, and please don't change good TEI XML to bad TEI in an attempt to make it render more successfully; report the problem to us and we'll look into it.

3 Basic Text Structure

A jTEI journal article is a relatively simple TEI document consisting of a <teiHeader> and a <text>.

3.1 The Header and Metadata

This is an example <teiHeader>:

```
<teiHeader>
  <fileDesc>
    <titleStmt>
      <title type="main">Learning the TEI in a Digital Environment</title>
      <author>
        <name>
          <forename>Stella</forename>
          <surname>Dee</surname>
        </name>
        <affiliation>Stella Dee is currently a <roleName>Research Associate</roleName>
          working to develop e-learning resources for historical languages with the
          Open Philology Project at the <orgName>University of Leipzig</orgName>.
          The research of this article was conducted while studying for a Masters
          degree in digital humanities at King's College, London.</affiliation>
        <email>dee@informatik.uni-leipzig.de</email>
      </author>
    </titleStmt>
    <publicationStmt>
      <publisher>TEI Consortium</publisher>
      <date>2014</date>
      <idno>Issue 7</idno>
      <availability>
        <licence target="https://creativecommons.org/licenses/by/4.0/">
          <p>For this publication, a Creative Commons Attribution 4.0
            International license has been granted by the author(s), who
            retain full copyright.</p>
        </licence>
      </availability>
    </publicationStmt>
    <sourceDesc>
      <p>No source, born digital.</p>
    </sourceDesc>
  </fileDesc>
  <encodingDesc>
    <projectDesc>
      <p>Revues.org -centre for open electronic publishing- is the platform for journals
        in the humanities and social sciences, open to quality periodicals looking to publish
        full-text articles online.</p>
    </projectDesc>
  </encodingDesc>
  <profileDesc>
```

```
<langUsage>
  <language ident="en"/>
</langUsage>
<textClass>
  <keywords xml:lang="en">
    <term>pedagogy</term>
    <term>student resources</term>
    <term>survey</term>
    <term>file publication</term>
  </keywords>
</textClass>
</profileDesc>
</teiHeader>
```

Some of the content is boilerplate material provided by the template. These are the parts that you must supply:

- The title of your article (in `fileDesc/titleStmt/title[@type='main']`).
- Author information for each author (in `fileDesc/titleStmt/author`). Provide one `<author>` element for each author. Encode the names as shown, using `<forename>` and `<surname>`, inside `<name>`. Then provide a brief biographical paragraph for each author in `<affiliation>`, and an email address.
- Keywords (in `profileDesc/textClass/keywords`). Provide a handful of general categories under which you feel your article fits. There is (currently) no formal ontology of article categories to choose from. You may consult the list of keywords from previous articles on the journal website, but if you don't see what you need, feel free to use new ones. The editors may formalize these categories in future.

3.2 Front Matter

The front matter must consist of an abstract, encoded in `<div type="abstract">`. This should consist of one or two short paragraphs, covering the purpose and content of the article.

The only other thing that may appear in the front matter is a brief acknowledgements section. If you need to include this to acknowledge contributors, funding agencies etc., insert it after the abstract, encoded as `<div type="acknowledgements">`. It should be no longer than one short paragraph.

3.3 The Body

The content of the article appears in the body. It should be divided into sections using `<div>` elements. Each `<div>` element should have an *xml:id* attribute, and its first child should be a `<head>` element with a suitable heading (in title case). `<div>` elements may be nested to provide subsections.

Do not provide section numbering explicitly in the `<head>`s of your `<div>`s. These will be provided automatically by the rendering tools.

3.4 Back Matter: the Bibliography and Appendices

The back matter consists of a bibliography (required), which is encoded in `<div type="bibliography">`, and optional appendices, each of which if present must be encoded using `<div type="appendix">`. Appendices must appear after the bibliography.

The bibliography consists of a `<listBibl>` element containing a series of `<bibl>` elements. Each `<bibl>` element should contain a reference formatted as required by the *Chicago Manual of Style* (16th edition), including all required punctuation, with a couple of exceptions:

- Do not provide quotation marks around article titles. Instead, tag them with `<title level="a">` (for chapters or contributions in a monograph, or journal articles) or `<title level="u">` (for unpublished materials). The rendering tools will then provide the quotation marks.
- Tag titles that would normally be in italics using `<title level="j">` (for journal titles) or `<title level="m">` (for monographs).

Give each `<bibl>` element a unique *xml:id* attribute, so that you can link to it from the quotations in the body of your text. In your bibliography entries, put the appropriate tags around the following components:

- titles: `<title>`, with an appropriate value for *level* (see above)
- editions: `<edition>`
- dates: `<date>`
- authors: `<author>`
- editors: `<editor>`
- publishers: `<publisher>`
- publication places: `<pubPlace>`
- name of series: `<series>`
- scope of a bibliographic reference: `<biblScope>`, with an appropriate value for *unit* (volume, issue, page, chapter, part)
- id numbers such as DOIs: `<idno>`, with an appropriate value for *type*
- web urls (use `<ref>`)

Note: if you have both a formal identification number such as a DOI code and a hyperlink to an online version, the DOI code should be placed last in the bibliographic description.

Here is a short example:

```
<div xml:id="bibliography"
  type="bibliography">
  <listBibl>
    <bibl xml:id="aoki07">
      <author>Aoki, Paul M.</author>
      <date>2007</date>.
      <title level="a">Back Stage on the Front Lines: Perspectives and
        Performance in the Combat Information Center</title>. In
      <title level="m">Proceedings of the SIGCHI Conference on
        Human Factors in Computing Systems</title>,
      <biblScope unit="page">717–26</biblScope>. CHI '07.
      <pubPlace>New York</pubPlace>: <publisher>ACM</publisher>. <ref tar-
get="http://doi.acm.org.ezproxy.lib.utexas.edu/10.1145/1240624.1240735">

</bibl>
<!-- ... -->
</listBibl>
</div>
```

4 Divisions, Paragraphs, Lists and Other Block Elements

4.1 Divisions

Text divisions are encoded in `<div>`. Each division must have a `<head>` containing the heading for this division. Headings should just contain the bare heading, without numbering or other labels; those are added automatically when the TEI source file is rendered.

Divisions typically consist of a number of paragraphs, inside `<p>` elements. Apart from paragraphs, they can contain following text structures:

- subdivisions
- lists
- quotations
- figures and graphics
- tables
- code examples

Divisions can nest, by simply including a new `<div>` element with an *xml:id* attribute and a `<head>` in a parent division. There's no need to indicate the nesting level for subdivisions: this is determined from the structural encoding by the rendering scripts. Please note that the general TEI limitations hold: divisions may not be followed by bare paragraphs. In order to facilitate cross-referencing, you are encouraged to provide a unique identification code in an *xml:id* attribute for each `<div>`.

Following example illustrates a text division in which two introductory paragraphs are being followed by two more subdivisions.

```
<body>
<div xml:id="notodd">
  <head>What's not ODD?</head>
  <p>In the current source of TEI P5, there is extensive use of several different
    XML vocabularies: <list rend="bulleted">
    <item>Examples in TEI P5 are presented as if they belonged to some other
    <soCalled>TEI Example Namespace</soCalled>;</item>
    <item>Element content models are expressed using a subset of RELAX NG, as
```

```

        discussed in the previous section;</item>
    <item>Datatypes are expressed in a variety of ways, mapping either to built-in
        W3C datatypes (as defined in the W3C Schema Language) or to RELAX NG
        constructs;</item>
    <item>Additional semantic constraints (for example, co-dependence of
        attributes and element content) are expressed using ISO Schematron
        rules.</item>
</list>
</p>
<p>Everything else in a TEI-conformant ODD specification uses only constructs from
    the TEI namespace. In this paper, we will argue for a further extension of the
    ODD language to replace several of the cases listed above.</p>
<div xml:id="elementcontentmodels">
    <head>Element Content Models</head>
    <p>ODD was originally intended to support the <emph>intersection</emph> of the
        content models definable using three different schema languages. In practice,
        this reduced our modeling requirements quite significantly.
<!-- ... -->
</p>
<!-- ... -->
</div>
<div xml:id="datatyping">
    <head>Datatyping and Other Forms of Validation</head>
    <p>Validation of an element's content model is but one of many different layers
        of validation that a TEI user may wish to express in their ODD specification.
<!-- ... -->
</p>
<!-- ... -->
</div>
</div>
</body>

```

4.2 Paragraphs

Paragraphs are encoded with `<p>` elements. They are the main building blocks of a division. They can contain plain text, mixed with other structural elements:

```

<p>Thus we introduce the <gi>transferGrp</gi> element, a grouping element somewhat
    like <gi>surfaceGrp</gi> but, like <gi>altGrp</gi> or <gi>attList</gi>, with
    the ability to assert the relationship among its children rather than just common
    features. This is accomplished with an <att>org</att> attribute whose suggested
    values include:
<list type="gloss">
    <label>
        <val>group</val>
    </label>
    <item>an unordered set</item>
    <label>
        <val>sequence</val>
    </label>
    <item>a (chronologically) ordered set</item>
    <label>
        <val>choice</val>
    </label>
    <item>only one of the child <gi>transfer</gi>s
        obtained</item>
</list>
</p>
<p>The following example demonstrates the use of <gi>transferGrp</gi> to indicate a

```

transaction which is attested in (at least) two source documents which disagree as to the amount of money involved.</p>

4.3 Lists

Lists in jTEI are relatively simple. They are encoded in a <list> element and differentiated by the *type* attribute, which may have only one value, *gloss*. <list type="gloss"> is (as you might expect) a glossary list, and must consist of a sequence of <label>s and <item>s, like this:

```
<list type="gloss">
  <label>compressor</label>
  <item>a device which reduces the peaks of volume in an audio signal</item>
  <label>equalizer</label>
  <item>a device which allows different frequency bands in an audio signal
    to be cut or boosted</item>
</list>
```

All other types of list (numbered, bulleted etc.) do not have the *type* attribute. Their appearance is controlled by the *rend* attribute:

<list> contains any sequence of items organized as a list.

@*rend* (rendition) describes the way the list should be rendered.

Lists may be nested:

```
<list rend="bulleted">
  <item>compressor:
    <list rend="ordered">
      <item>limiter</item>
      <item>multiband compressor</item>
    </list>
  </item>
  <item>equalizer:
    <list rend="ordered">
      <item>graphic equalizer</item>
      <item>parametric equalizer</item>
    </list>
  </item>
</list>
```

For processing reasons, jTEI puts one restriction on what can appear inside lists: you can't use <table> anywhere inside <item>.

4.4 Quotations, Inline and Block

The main components of a quotation are the quoted text itself, and a reference to the source it was quoted from. The quoted text is encoded with a <quote> element, without quotation marks. Quotations marks are added automatically by the rendering scripts. The jTEI schema requires that each quotation is linked to a bibliographic reference, identifying the source from where the text has been quoted. Typically, the source of a quotation is listed in the bibliography at the end of the article. References to such sources are encoded in a <ref> element, with a *type* attribute of value *bibl*, whose *target* attribute must point to the *xml:id* value of a <bibl> element in the article's bibliography. You must provide an *xml:id* attribute for the <ref> element itself. This makes it possible to connect the quotation with its specific reference via the *source* attribute on the <quote> element:

```
<p>In his blog post, <title level="a">Text: A Massively Addressable Object</title>,
published in the 2012 anthology <title level="m">Debates in the Digital
Humanities</title>, Michael Witmore defines texts as objects that are
<quote source="#quoteref3">massively addressable at different levels of scale</quote>
(<ref type="bibl" xml:id="quoteref3"
target="#witmore12">Witmore 2012, 325</ref>).
</p>
```

Here, we see how the value `#quoteref3` for the *source* attribute expresses the correspondence with the bibliographic reference in `<ref type="bibl" xml:id="quoteref3" target="#witmore12">Witmore 2012, 325</ref>`.

In some cases, quotations are taken from less bibliographic sources, such as email conversations and other non-published texts. Such sources are not listed in the bibliography, so you can't refer to them with a `<ref type="bibl">` reference. Instead, you should include the description of the source in the text. The description should be encoded in a `<bibl>` element with an *xml:id* attribute. You should link the quotation to this bibliographic description by pointing to this *xml:id* attribute with the *source* attribute of the `<quote>` element:

```
<p>An exchange on the TEI electronic mailing list sparked the research published
in this article, when a community expert wrote that given
<quote source="#quoteref1">a graduate student in English who has heard about TEI
and wants to dip her toes into it because she thinks it may be a better way of
putting on the Web some 17th century poems<gap/> Where does she go for help?
Where in the TEI universe is the level of ubiquitous Grade I support?</quote>
(<bibl xml:id="quoteref1">Martin Mueller, pers. comm, Jan. 18, 2013</bibl>).</p>
```

Here, the `#quoteref1` value for the *source* attribute on `<quote>` points to the `<bibl>` element in the text, describing the less bibliographic source for the quotation in a footnote.

Note how the examples above were inline quotations, which will be rendered inside the running text of the paragraph they appear in. It is also possible to encode block quotations, by wrapping the `<quote>` and its `<ref>` inside a `<cit>` container. A `<cit>` element can occur either in or between paragraphs, but is always rendered as a blockquote:

```
<p>In <title level="a">Wampum as Hypertext</title>, Angela Haas complicates the
distinction between technology and high technology by discussing the way wampum
belts function the same as Western hypertexts. Haas contends that while there are
many similarities, they differ when we understand the way wampum is reliant on
cultural practices and memory:
<cit>
  <quote source="#quoteref8">Consequently one could argue that wampum is limited
in relation to contemporary Western hypertexts in that it requires human
intervention to remember the intent and content of the original message; however,
one could also posit that such interaction encourages continuous civic
involvement
instead of an over-reliance on technology.</quote>
  <ref type="bibl" xml:id="quoteref8"
target="#haas07">Haas 2007, 93</ref>
</cit>
</p>
```

The `<cit>` element has been constrained in jTEI so it can only contain `<quote>`, `<ref>`, and `<bibl>`.

Inside quotations, inline rhetorical elements can be used (see 5. *Inline Rhetorical Elements*). Two of such elements are quite specific to quotations, in the context of a jTEI article, however,

namely omissions and supplied text. Omissions are encoded with `<gap>`, which at rendering time is transformed to the typographic omission symbol: ...¹. If you supply text that wasn't present in the original quotation, you should wrap the supplied text in a `<supplied>` element. At rendering time, the `<supplied>` start and end tags are replaced with the `[` and `]` characters, respectively.

Apart from `<quote>` for attributed quotations, you can also use `<q>` for short anonymous inline quotations, whose source is not known or irrelevant. This is discussed in more detail in 5. *Inline Rhetorical Elements*.

4.5 Figures and Graphics

Illustrative figures are encoded using the `<figure>` element, along with a mandatory `<head type="legend">` element providing the caption for the figure, as in this example:

```
<figure xml:id="titlePage">
  <graphic url="img/titlePage.png"
    width="620px" height="980px"/>
  <head type="legend">The title page of the 1598 edition</head>
</figure>
```

The graphics file should be in PNG or JPEG format, and should be stored in a directory called **img** which is a sibling of the article XML file. Graphics file names should not contain spaces or punctuation. The `<graphic>` element must include the *width* and *height* attributes containing the image size in pixels. A second `<head type="license">` may also be provided in cases where an explicit statement of licensing, copyright or accreditation is required.

The caption in the `<head type="legend">` element should *not* begin with Figure 1 or any similar prefix; this will be provided by the rendering code at output time. To link to the figure, all you need to do is to provide a pointer targeting its *xml:id* attribute, like this:

```
<p>As you can see from <ptr target="#titlePage" type="crossref"/>,
the title page is damaged...</p>
```

This will be expanded at rendering time into Figure X, where X is the appropriate figure number.

4.6 Example Code, XML and non-XML

Example computer code in jTEI falls into two categories. XML code appears in the `<egXML xmlns="http://www.tei-c.org/ns/Examples">` element. When you use this element, make sure you get the namespace right; all elements appearing in the `<egXML>` element are also in the Examples namespace, to distinguish them from regular TEI elements that are part of the encoding of the document. Code from non-XML languages appears in the `<eg>` element.

In many cases, example code will appear inline as part of the prose of your article²:

```
<p>Links between authors and books are encoded using <gi>link</gi> elements: <egXML
xmlns="http://www.tei-c.org/ns/Examples"> <link target="#middlemarch #eliot"/>
</egXML> </p>
```

¹Note, if you're omitting text at the end of a sentence, the sentence punctuation should precede the `<gap>` element.

²Note, however, that `<eg>` and `<egXML>` examples are always *rendered* as blocks, regardless of their appearance as inline or block-level elements in the article encoding. If you want to include a short code fragment that should be rendered inline, you can use the `<code>` element as discussed in 6. *Inline Technical Elements*.

You might want to provide a caption for code examples. In these cases, the `<eg>` or `<egXML>` element should be enclosed in a `<figure>`:

```
<figure xml:id="example_code_1">
  <eg> declare function local:getTitles($source as element(div)) as xs:string*{
    for $t in $source//title
    return xs:string($t)
  };
</eg>
<head type="legend">A simple XQuery function</head>
</figure>
```

At rendering time, captions of examples will be supplied with a leading Example X, where X is the number of the example. You can link to and refer to block examples like this using `<ref>` and `<ptr>`. In order to do so, you should provide a unique identification code to the `<figure>` in an `xml:id` attribute.

4.7 Tables

Tables can be encoded with the `<table>` element. Tables consist of a number of rows (`<row>`) that contain a number of cells (`<cell>`). Header rows and cells can be distinguished by different values for the *type* attribute:

label The row or cell contains a header, not actual data.

data (default) The row or cell contains data.

Cells and rows can be merged. In order to indicate how many columns a row or cell spans, a number can be provided for a *cols* attribute; the number of rows spanned can be given as value for a *rows* attribute.

```
<table xml:id="table1">
  <head>Elements in <ident>tei_corset</ident> customization</head>
  <row role="label">
    <cell>Module</cell>
    <cell>Elements in <ident>tei_corset</ident>
  </row>
  <row>
    <cell role="label">
      <ident>textstructure</ident>
    </cell>
    <cell>
      <gi>body</gi>
      <gi>div</gi>
      <gi>TEI</gi>
    </cell>
  </row>
  <row>
    <cell role="label">
      <ident>figures</ident>
    </cell>
    <cell>
      <gi>cell</gi>
      <gi>row</gi>
      <gi>table</gi>
    </cell>
  </row>
```

```
<row>
  <cell cols="2">a sample cell spanning two columns (this was not in the original)</cell>
</row>
</table>
```

The example above illustrates how the first row is marked as a header row with `<row role="label">`, and how the left column is marked as a header column by specifying each first cell in a row as `<cell role="label">`. The last cell illustrates how column spanning can be indicated with `<cell cols="2">`.

Note how the example also illustrates how tables can have headings, in a `<head>` element. The text of this heading should *not* begin with Table 1 or any similar prefix; this will be provided when the article is rendered. To link to the table, all you need to do is to provide a pointer targeting its *xml:id* attribute:

```
<p>As you can see from <ptr target="#table1" type="crossref"/>, the elements included...</p>
```

This will be expanded at rendering time into Table X, where X is the appropriate table number.

5 Inline Rhetorical Elements

The jTEI schema prompts you to encode information as much as possible with conceptual tags. Therefore, the general-purpose `<hi>` tag has been removed from the jTEI schema. Instead, you should use more semantically expressive elements for identifying the rhetorical phenomenon you want to encode. If you want to stress a word in a sentence, you can do so with the `<emph>` element, which is rendered as italicized text. Foreign terms can be tagged with `<foreign>`, with a proper language identification code for the *xml:lang* attribute. Technical terms, or terms in general, can be encoded with `<term>`, and appear as italicized text in the rendered article.

```
<p>
  <term>Interoperability</term> may be defined as the property of data that allows
  it to be loaded <emph>unmodified</emph> and fully used in a <emph>variety</emph>
  of software applications. <term>Interchange</term> is basically the same property
  that applies after a preliminary conversion of the data
  (<ref type="bibl" target="#bauman11">Bauman
    2011</ref>; <ref type="bibl" target="#unsworth11">Unsworth 2011</ref>), and
  implies some loss of information in the process. Interchange can thus be seen as
  an easier, less stringent or less useful kind of information exchange than pure
  interoperability.
</p>
```

```
<p>Unicode is a <emph>character</emph> encoding standard, and is not intended to
standardize ligatures or other presentation forms
(<ref type="bibl" xml:id="quoteref16"
  target="#unicode14">Unicode 2014</ref>).
For example, there is no Unicode character for old Latin
<foreign xml:lang="la">sescuncia</foreign>
(like a pound-sign, = one eighth), since it can be composed from
<foreign xml:lang="la">semuncia</foreign>
(character 10192) and an EN-dash (<ref type="bibl" target="#unicode06">Unicode 2006,
4</ref>)</p>
```

Another category of inline rhetorical elements are those that are used for text that is somehow quoted. When a word is mentioned to illustrate its form or usage, without its actual meaning, it should be encoded as `<mentioned>`. At rendering time, it will be displayed in italics. When you use a word while at the same time distancing yourself from it, you should encode it with `<soCalled>`. At rendering time, the start and end tag will be replaced with double quotation marks. Finally, if you want to quote a word or passage without attributing it to an external source, you can use the `<q>` element. Such anonymous quotations are rendered in double quotation marks.

The actual form of the quotation marks depends on the nesting level of quotation marks, so that double and single quotation marks alternate when they nest. For example, if a word tagged as `<soCalled>` appears inside a `<q>` element, then the quoted text will be wrapped in *double* quotation marks, while the text inside `<soCalled>` will be rendered with *single* quotation marks.

```
<p>The standard definition of metadata as <q>data about data</q> seems to pose more questions than it answers.</p>
```

```
<p>There are possible ways (<soCalled>hacks</soCalled>) around some of these problems even without rewriting the software, and some software is open source. For example, some software may permit dates in the <emph>future</emph>, in which case a project might record eighteenth-century dates using values from the twenty-eighth century. Pounds, shillings, and pence could be converted to a modern standard unit (for example, US dollars; <ref target="http://www.measuringworth.com/">Measuring Worth</ref> provides calculators for determining values in some historical currencies). A project could consistently use the <mentioned>comments</mentioned>, <mentioned>memo</mentioned>, or <mentioned>notes</mentioned> field to record pointers into the attesting document.</p>
```

If you mention titles in paragraph text, you should encode them as such, with the `<title>` element and a proper type for the *level* attribute. Titles of journals (`level="j"` for *level*) and monographs (`m`) are rendered in italics. Titles of book chapters or journal articles (`a`), or unpublished materials (`u`) are enclosed in quotation marks at rendering time (so you mustn't provide them yourself).

6 Inline Technical Elements

Due to the nature of this journal, a discussion of technical XML or TEI elements is a common feature in jTEI articles. When elements from an XML vocabulary are discussed, they should be identified in a `<gi>` element, with an optional *scheme* attribute in which the XML vocabulary can be named. The default value for this attribute is TEI for TEI elements; others could be HTML, Schematron, DBK (Docbook), etc. At rendering time, the `<gi>` start and end tags are replaced with the `<` and `>` characters, respectively. The element name is always presented in this form: `<p>` in the output rendering, even if it is an empty element which in actual usage is almost always self-closing, such as `<lb>` or `<pb>`.

Attribute names should be tagged in an `<att>` element, which at rendering time will be preceded with a `@` character. Attribute values should be tagged in `<val>`. At rendering time, the `<val>` start and end tags are replaced with straight quotation marks, so there is no need to quote the values yourself.

7 FOOTNOTES

<p>For example, the extension of credit can be represented in a transactionography by the transfer of a commodity of indebtedness. We have been using the keyword **<val>iou</val>** as the value of **<att>commodity</att>** of **<gi>measure</gi>** for this purpose.**</p>**

When you want to quote an instance of a single start or end tag, you should use the **<tag>** element. If you want to specify the XML vocabulary this tag belongs to, this can be done in the *scheme* attribute (see above). In the *type* attribute, you can specify the kind of tag: start (start tag), end (end tag), empty (an empty tag), pi (processing instruction), comment (an XML comment), or ms (a CDATA marked section). For all these types of tags, the proper delimiters (starting with the **<** and ending with the **>** characters) are inserted when the article is rendered. Note, for full-fledged XML examples, the **<egXML>** element should be used (see 4.6. *Example Code, XML and non-XML*).

<p>A range like **<code>#range(left(//lb[@n='3']),left(//lb[@n='4']))</code>**, however, could unambiguously address the sequence of nodes comprising line 3, even if the **<gi>lb</gi>** happened to be a child of another element that began in the previous line.**</p>**
<!-- ... -->
<p>For example, **<tag type="empty">rng:ref name="model.pLike"</tag>** becomes **<tag type="empty">classRef key="model.pLike"</tag>**.**</p>**

If you want to cite a brief inline code fragment from a formal programming language, you can use the **<code>** element. With the *lang* attribute, you can identify the language of the code:

<p>Most of the time, pointing from one part of a TEI document to another, it is easy to use IDs. Simply wrap the thing in an element, give that element an **<att>xml:id</att>** attribute (say, **<code>xml:id="foo"</code>**), and point at the ID using either a URI with an appended fragment identifier (**<val>#foo</val>**) or using an attribute whose type is IDREF.**</p>**

The **<ident>** element should be used to encode identifiers in a formal language, such as variable, class, and function names in a programming language. When discussing the TEI encoding scheme or customizations, the names of model and attribute classes, datatypes, macros, and TEI customizations should be encoded with **<ident>**:

<p>For example **<ident>data.duration.iso</ident>**, **<ident>data.outputMeasurement</ident>**, **<ident>data.pattern</ident>**, **<ident>data.point</ident>**, **<ident>data.version</ident>**, and **<ident>data.word</ident>** all map to the same datatype CDATA in XML DTD, and to various TEI-defined regular expressions in RELAX NG or W3C Schema.**</p>**

7 Footnotes

jTEI articles can have footnotes. Since no other notes are supported, the encoding is fairly simple: just add a **<note>** element at the place where you want to insert the footnote in the text. No further attributes are required: numbering is catered for at rendering time. Notes can contain plain text or paragraphs. No block-level elements are allowed:

<p>There are essentially two pointing mechanisms TEI employs to implement its graph data structure: XPath, used in the **<att>match</att>** attribute, **<note>**

```

    <p>See                <ptr target="http://www.tei-c.org/Vault/P5/2.2.0/doc/tei-p5-
doc/en/html/ref-att.scoping.html"/>
  </p>
  </note> and URIs, which can indicate documents, or (using fragment identifiers)
elements in the current document which have <att>xml:id</att> attributes.</p>

```

8 Internal Linking

Internal links are cross-links within the article. In jTEI, you can point to other text structures that can have labels, namely <div>, <figure> (containing either graphics or code examples), or <table>. Additionally, internal links can point to footnotes inside <note> elements, too. You can link to those structures either with an unlabeled cross-reference in <ptr>, or with a labeled link in <ref>. Both must have a *type* attribute with value *crossref*, and a *target* attribute, whose value should start with the # sign, followed by the *xml:id* value of the element it addresses:

```

<p>
  <ref type="crossref" target="#figure2">The following figure</ref> shows a typical
example of such a tag document.
<figure xml:id="figure2">
  <graphic url="img/tagdoc-p2.png"
    width="642px" height="716px"/>
  <head type="legend">Tagdoc for <gi>resp</gi> element in P2.</head>
</figure>
</p>

```

For unlabeled cross-links, the <ptr type="crossref" xml:id="#link-target"> is replaced with an appropriate label for the link target at rendering time:

```

<p>
  <ptr target="#table2" type="crossref"/> shows allowable <att>rend</att> values and
their equivalent meanings.
</p>
<table xml:id="table2">
  <head>Allowable <att>rend</att> attribute values in <ident>tei_corset</ident>
customization</head>
  <row role="label">
    <cell>
      <att>rend</att>
      <lb/>(renamed <att>r</att>) <lb/>attribute value</cell>
    <cell>Meaning</cell>
  </row>
  <!-- ... -->
</table>

```

In the generated ODT, OpenEdition, and PDF version, the cross-reference is rendered as: Table X shows allowable @rend values and their equivalent meanings.

Note how internal links are rendered as plain text instead of hyperlinks in the ODT version and the final version in revues.org.

Another type of internal linking consists of bibliographic references, pointing to entries in the bibliography. This should be done with a specific type of <ref> element, with value *bibl* for the *type* attribute. The value of the *target* attribute for bibliographic references must point to a <bibl> element in the bibliography:

```
<p>Thomas notes numerous additional developments in the use of computers in historical
study, both in the United States and elsewhere between the 1940s and the early
twenty-first century (<ref type="bibl" target="#thomas04">Thomas 2004</ref>).</p>
<!-- ... -->
<back>
  <div type="bibliography">
    <listBibl>
      <bibl xml:id="thomas04">
        <author>Thomas, William G., III</author>. <date>2004</date>.
        <title level="a">Computing and the Historical Imagination</title>:
        <title level="m">A Companion to Digital Humanities</title>, edited by
        <editor>Susan Schreibman</editor>, <editor>Ray Siemens</editor>, and
        <editor>John Unsworth</editor>. <pubPlace>Oxford</pubPlace>:
        <publisher>Blackwell Publishing</publisher>.</bibl>
      </listBibl>
    </div>
  </back>
```

Note, how all characters surrounding bibliographic references have to be hard-coded in the text; they are not generated automatically at rendering time. For linking bibliographic references with quotations, see 4.4. *Quotations, Inline and Block*.

9 External Linking

Links to external destinations can be encoded with <ptr> (unlabeled) or <ref> (labeled). They must have a *target* attribute whose value is the URI of the link's destination:

```
<item>addresses the range between two points (<ref target="http://www.tei-
c.org/Vault/P5/2.2.0/doc/tei-p5-doc/en/html/SA.html#SATSRN">16.2.5.4
range()</ref>)</item>
```

```
<p>More detailed information can be found at <ptr target="http://www.tei-
c.org/Vault/P5/2.5.0/doc/tei-p5-doc/en/html/ref-elementSpec.html"/>.</p>
```

At rendering time, both types of links are transformed to clickable hyperlinks, and for <ptr> the value of the *target* attribute is used as the link label.

One caveat for external links to the TEI Guidelines: since the web version at <http://www.tei-c.org/Guidelines/P5/> is unstable and will be updated at each new release, you *must* point to the archived versions in the Vault section of the TEI website. There, you can find an archive of all previous TEI releases and their documentation. Follow the links to the exact version you're referencing in your article (even if it's the current version), and use them for your external hyperlinks. In the examples above, the first link points to the documentation of version 2.2.0 of the TEI Guidelines, while the second link points to version 2.5.0.

10 Frequently-asked Questions

- Where did <hi> go? How do I do italics?

We're trying to avoid <hi> because it's so widely used in so many different ways. We would also prefer that all styling be applied for semantic reasons, so rather than italics, think journal title or emphasis or foreign word. Also, what you believe should be in italics might in our style guide be rendered in quotation marks, or not styled at all; that's why it's easier if you identify things and let the system style them.

-
- Why can't I use quotation marks?

Literal quotation marks can be straight double, straight single, curly double, curly single, or (if you happen to be on a non-English keyboard) a range of other symbols. All copyeditors are familiar with the tedium of checking that they're all the right form, and that all the initial ones are opening ones and the closing ones are the matching closing ones. It's much simpler if you tag your text as `<quote>`, `<soCalled>` or whatever, and let the XSLT provide the quotation marks in a reliable way.

- Why is this so restrictive?

The TEI is a huge standard; there are lots of available approaches to encoding any given phenomenon, and every TEI user has their own habits and preferences, arising out of their history and the projects they've worked on. If we accept submissions in any valid TEI (`tei_all`), we inevitably spend many hours re-encoding them to get something that will work with our system. It's much simpler if we let the schema do the work for us.

A.1 Elements

<TEI> (TEI document) contains a single TEI-conformant document, combining a single TEI header with one or more members of the `model.resourceLike` class. Multiple **<TEI>** elements may be combined to form a **<teiCorpus>** element. [4. Default Text Structure 15.1. Varieties of Composite Text]

Module textstructure

Attributes Attributes `att.global` (`@xml:id`, `@n`, `@xml:lang`, `@xml:base`, `@xml:space`)
(`att.global.rendition` (`@rend`, `@rendition`)) (`att.global.responsibility` (`@cert`, `@resp`))
(`att.global.source` (`@source`)) `att.typed` (`@type`)

Contained by —

May contain

header: `teiHeader`

textstructure: `text`

Note This element is required. It is customary to specify the TEI namespace `http://www.tei-c.org/ns/1.0` on it, using the `xmlns` attribute.

Example

```

<TEI version="5.0" xmlns="http://www.tei-c.org/ns/1.0">
  <teiHeader>
    <fileDesc>
      <titleStmt>
        <title>The shortest TEI Document Imaginable</title>
      </titleStmt>
      <publicationStmt>

```

A SUMMARY OF ELEMENTS AND THEIR RENDITION

```
<p>First published as part of TEI P2, this is the P5
  version using a name space.</p>
</publicationStmt>
<sourceDesc>
  <p>No source: this is an original work.</p>
</sourceDesc>
</fileDesc>
</teiHeader>
<text>
  <body>
    <p>This is about the shortest TEI document imaginable.</p>
  </body>
</text>
</TEI>
```

  att.global.attributes,
  att.typed.attributes,
  ( teiHeader, model.resourceLike+ )
}
```

<abbr> (abbreviation) contains an abbreviation of any sort. [3.5.5. Abbreviations and Their Expansions]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))

@type allows the encoder to classify the abbreviation according to some convenient typology.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Sample values include: **suspension** the abbreviation provides the first letter(s) of the word or phrase, omitting the remainder.

contraction the abbreviation omits some letter(s) in the middle.

brevigraph the abbreviation comprises a special symbol or mark.

superscription the abbreviation includes writing above the line.

acronym the abbreviation comprises the initial letters of the words of a phrase.

title the abbreviation is for a title of address (Dr, Ms, Mr, ...)

organization the abbreviation is for the name of an organization.

geographic the abbreviation is for a geographic name.

Note The *type* attribute is provided for the sake of those who wish to classify abbreviations at their point of occurrence; this may be useful in some circumstances, though usually the same abbreviation will have the same type in all occurrences. As the sample values make clear, abbreviations may be classified by the method used to construct them, the method of writing them, or the referent of the term abbreviated; the typology used is up to the encoder and should be carefully planned to meet the needs of the expected use. For a typology of Middle English abbreviations, see PETTY

A SUMMARY OF ELEMENTS AND THEIR RENDITION

tagdocs: att code gi ident tag val

transcr: supplied

character data

Note The <abbr> tag is not required; if appropriate, the encoder may transcribe abbreviations in the source text silently, without tagging them. If abbreviations are not transcribed directly but *expanded* silently, then the TEI header should so indicate.

Example

```
<choice>
  <expan>North Atlantic Treaty Organization</expan>
  <abbr cert="low">NorATO</abbr>
  <abbr cert="high">NATO</abbr>
  <abbr cert="high" xml:lang="fr">OTAN</abbr>
</choice>
```

Example

```
<choice>
  <abbr>SPQR</abbr>
  <expan>senatus populusque romanorum</expan>
</choice>
```

Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element abbr
{
  att.global.attributes,
  attribute type { text }?,
  macro.phraseSeq}
```

<affiliation> contains an informal description of a person's present or past affiliation with some organization, for example an employer or sponsor. [15.2.2. The Participant Description]

Module namesdates

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.editLike (att.dimensions) att.dataable.w3c (~~not~~After, @when, @notBefore, @from, @to)

@type characterizes the element in some sense, using any convenient classification scheme or typology.

character data

Note If included, the name of an organization may be tagged using either the <name> element as above, or the more specific <orgName> element.

Example

```
<affiliation>Junior project officer for the US <name type="org">National  
Endowment for  
the Humanities</name>  
</affiliation>
```

Example This example indicates that the person was affiliated with the Australian Journalists Association at some point between the date ranges listed.

```
<affiliation notAfter="1960-01-01"  
notBefore="1957-02-28">Paid up member of the  
<orgName>Australian Journalists Association</orgName>  
</affiliation>
```

Example This example indicates that the person was affiliated with Mount Holyoke College throughout the entire span of the date ranges listed.

```
<affiliation from="1902-01-01"  
to="1906-01-01">Was an assistant professor at Mount Holyoke  
College.</affiliation>
```

macro.phraseSeq}
```

<appInfo> (application information) records information about an application which has edited the TEI file. [2.3.10. The Application Information Element]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))

Member of model.encodingDescPart

Contained by

header: encodingDesc

May contain

header: application

Example

```
<appInfo>
  <application version="1.24" ident="Xaira">
    <label>XAIRA Indexer</label>
    <ptr target="#P1"/>
  </application>
</appInfo>
```

Content model

```
<content>
  <classRef key="model.applicationLike"
    minOccurs="1" maxOccurs="unbounded"/>
</content>
```

Schema Declaration

```
element appInfo { att.global.attributes, model.applicationLike+ }
```

<application> provides information about an application which has acted upon the document. [2.3.10. The Application Information Element]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source)) att.dataable.w3c (~~notAfter~~, @when, @notBefore, @from,
@to)

@ident supplies an identifier for the application, independent of its version number or display name.

Status Required

Datatype teidata.name

@version supplies a version number for the application, independent of its identifier or display name.

Status Required

Datatype teidata.versionNumber

Member of model.applicationLike

Contained by

header: appInfo

May contain

core: desc label p ptr ref

Example

```
<appInfo>
  <application version="1.5"
    ident="ImageMarkupTool1" notAfter="2006-06-01">
    <label>Image Markup Tool</label>
    <ptr target="#P1"/>
    <ptr target="#P2"/>
  </application>
</appInfo>
```

This example shows an appInfo element documenting the fact that version 1.5 of the Image Markup Tool1 application has an interest in two parts of a document which was last saved on June 6 2006. The parts concerned are accessible at the URLs given as target for the two <ptr> elements.

Content model

```
<content>
  <sequence minOccurs="1" maxOccurs="1">
    <classRef key="model.labelLike"
      minOccurs="1" maxOccurs="unbounded"/>

soCalled term title

figures: figure

header: idno

namesdates: affiliation forename orgName roleName surname

tagdocs: att code gi ident tag val

transcr: supplied

character data

Note Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use a generally recognized name authority file to supply the content for this element. The attributes *key* or *ref* may also be used to reference canonical information about the author(s) intended from any appropriate authority, such as a library catalogue or online resource.

In the case of a broadcast, use this element for the name of the company or network responsible for making the broadcast.

Where an author is unknown or unspecified, this element may contain text such as *Unknown* or *Anonymous*. When the appropriate TEI modules are in use, it may also contain detailed tagging of the names used for people, organizations or places, in particular where multiple names are given.

Example

```
<author>British Broadcasting Corporation</author>
<author>La Fayette, Marie Madeleine Pioche de la Vergne, comtesse de
(1634–1693)</author>
<author>Anonymous</author>
<author>Bill and Melinda Gates Foundation</author>
<author>
  <persName>Beaumont, Francis</persName> and
  <persName>John Fletcher</persName>
</author>
<author>
  <orgName key="BBC">British Broadcasting
  Corporation</orgName>: Radio 3 Network
</author>
```

Schematron <sch:rule context="tei:titleStmt/tei:author"> <sch:assert test="tei:name and tei:affiliation and tei:email"> Author information in the <titleStmt> must include <name>, <affiliation> and <email>. </sch:assert> </sch:rule>

Content model

```
<content>

May contain

core: abbr date email emph foreign gap graphic hi lb mentioned name note num ptr ref
soCalled term title

figures: figure

header: idno

namesdates: affiliation forename orgName roleName surname

tagdocs: att code gi ident tag val

transcr: supplied

character data

Note When a single page is being cited, use the *from* and *to* attributes with an identical value. When no clear endpoint is provided, the *from* attribute may be used without *to*; for example a citation such as p. 3ff might be encoded **<biblScope from="3">p. 3ff</biblScope>**.

It is now considered good practice to supply this element as a sibling (rather than a child) of **<imprint>**, since it supplies information which does not constitute part of the imprint.

Example

```
<biblScope>pp 12–34</biblScope>
<biblScope unit="page" from="12" to="34"/>
<biblScope unit="volume">II</biblScope>
<biblScope unit="page">12</biblScope>
```

Content model

```

<catRef> (category reference) specifies one or more defined categories within some taxonomy or text typology. [2.4.3. The Text Classification]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source)) att.pointing (@target)

@scheme identifies the classification scheme within which the set of categories concerned is defined, for example by a **<taxonomy>** element, or by some other resource.

Status Optional

Datatype teidata.pointer

Contained by: textClass

May contain Empty element

Note The *scheme* attribute needs to be supplied only if more than one taxonomy has been declared.

Example

```

<catRef scheme="#myTopics"
  target="#news #prov #sales2"/>
<!-- elsewhere -->
<taxonomy xml:id="myTopics">
  <category xml:id="news">
    <catDesc>Newspapers</catDesc>
  </category>
  <category xml:id="prov">
    <catDesc>Provincial</catDesc>
  </category>
  <category xml:id="sales2">
    <catDesc>Low to average annual sales</catDesc>
  </category>
</taxonomy>

```

Content model `<content></content>`

Schema Declaration

```

element catRef
{
  att.global.attributes,
  att.pointing.attributes,
  attribute scheme { text }?,
  empty
}

```

@type characterizes the element in some sense, using any convenient
classification scheme or typology.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Legal values are: **abstract** (Abstract for the article, appearing inside
<front>.) Every article must include an abstract, consisting of
one or two paragraphs. This appears in the <front> element
and may not appear anywhere else.

acknowledgements (Acknowledgements for the article, appearing
inside <front>.) If an article includes a section for
acknowledgements (for funders, supporters, etc.), it should be as
brief as possible, and must appear in the <front> element and
nowhere else.

appendix (Appendix to the article, appearing inside <back>.)

Any appendices must appear in the <back> of the article, following the bibliography.

bibliography (Bibliography, appearing inside <back>.) Every article must include a bibliography, which appears as the first component of the <back> element, followed by any appendices.

editorialIntroduction (Editorial introduction, appearing inside <body>.) An editorial introduction to an issue must contain a <div type="editorialIntroduction">, which must appear in the <body> element and may not appear anywhere else.

<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element edition { att.global.attributes, macro.phraseSeq }
```

<editor> contains a secondary statement of responsibility for a bibliographic item, for example the name of an individual, institution or organization, (or of several such) acting as editor, compiler, translator, etc. [3.11.2.2. Titles, Authors, and Editors]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))

@role may be used to specify further information about the entity referenced by this name in the form of a set of whitespace-separated values, for example the occupation of a person, or the status of a place.

Derived from att.naming

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Legal values are: **translator**

guest

chief

managing

technical

Member of model.respLike

character data

Note A consistent format should be adopted.

Particularly where cataloguing is likely to be based on the content of the header, it is advisable to use generally recognized authority lists for the exact form of personal names.

Example

```
<editor role="Technical_Editor">Ron Van den Branden</editor>
<editor role="Editor-in-Chief">John Walsh</editor>
<editor role="Managing_Editor">Anne Baillot</editor>
```

Content model

```
<content>

A SUMMARY OF ELEMENTS AND THEIR RENDITION

tagdocs: att code gi ident tag val

transcr: supplied

character data

Note If the example contains material in XML markup, either it must be enclosed within a CDATA marked section, or character entity references must be used to represent the markup delimiters. If the example contains well-formed XML, it should be marked using the more specific `<egXML>` element.

Example

```
<p>The
<gi>term</gi> element is declared using the following syntax:
<eg><![CDATA[<!ELEMENT term (%phrase.content;)>]]</eg>
</p>
```

Content model

```
<content>
  <macroRef key="macro.phraseSeq"/>
</content>
```

Schema Declaration

```
element eg { att.global.attributes, macro.phraseSeq }
```

<egXML> (example of XML) a single XML fragment demonstrating the use of some XML, such as elements, attributes, or processing instructions, etc., in which the `<egXML>` element functions as the root element. [22.1.1. Phrase Level Terms]

Namespace <http://www.tei-c.org/ns/Examples>

Module tagdocs

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))

@valid indicates the intended validity of the example with respect to a schema.

Status Optional

Datatype teidata.enumerated

Legal values are: **true** the example is intended to be fully valid, assuming that its root element, or a provided root element, could have been used as a possible root element in the schema concerned.[Default]

feasible the example could be transformed into a valid document by inserting any number of valid attributes and child elements anywhere within it; or it is valid against a version of the schema concerned in which the provision of character data, list, element, or attribute values has been made optional.

false the example is not intended to be valid, and contains deliberate errors.

May contain Character data only

Note In the source of the TEI Guidelines, this element declares itself and its content as belonging to the namespace <http://www.tei-c.org/ns/Examples>. This enables the content of the element to be validated independently against the TEI scheme. Where this element is used outside this context, a different namespace or none at all may be preferable. The content must however be a well-formed XML fragment or document: where this is not the case, the more general <eg> element should be used in preference. In a TEI context use of the *rend* attribute in the TEI namespace, as opposed to the TEI Examples namespace, enables recording of rendition information.

Example

```
<egXML><div>
  <head>A slide about <gi>egXML</gi>
</head>
<list>
  <item>
    <gi>egXML</gi> can be used to give XML examples in the TEI
    Examples namespace</item>
  <item>Attributes values for <att>valid</att>:
    <list rend="collapsed">
      <item>
        <val rend="green">true</val>: intended to be fully
        valid</item>
      <item>
        <val rend="amber">feasible</val>: valid if missing nodes
        provided</item>
      <item>
        <val rend="red">>false</val>: not intended to be valid</item>
    </list>
  </item>
  <item>The <att>rend</att> attribute in the TEI namespace can be
    used for recording how parts of the example was rendered.</item>
</list>
</div>
</egXML>
```

Example

```
<egXML valid="feasible"><text>
  <front>
<!-- front matter for the whole group -->
  </front>
  <group>
    <text>
<!-- first text -->
    </text>
    <text>
<!-- second text -->
    </text>
  </group>
</text>
<!-- This example is not valid TEI, but could be made so by
adding missing components -->
</egXML>
```

A SUMMARY OF ELEMENTS AND THEIR RENDITION

Example

```
<egXML xmlns="http://www.tei-c.org/ns/Examples" valid="false">
  <para xml:lang="en">Doubloons are a pirate's best friend</para>
</egXML>
```

character data

Note The global *xml:lang* attribute should be supplied for this element to identify the language of the word or phrase marked. As elsewhere, its value should be a language tag as defined in 6.1. Language Identification.

This element is intended for use only where no other element is available to mark the phrase or words concerned. The global *xml:lang* attribute should be used in preference to this element where it is intended to mark the language of the whole of some text element.

The **<distinct>** element may be used to identify phrases belonging to sublanguages or registers not generally regarded as true languages.

Example

This is
heathen Greek to you still? Your **<foreign xml:lang="la">lapis
philosophicus</foreign>**?

Content model

</p>  
</div>  
</front>
```

Example

```
<front>  
<div type="dedication">  
<p>To our three selves</p>  
</div>  
<div type="preface">  
<head>Author's Note</head>  
<p>All the characters in this book are purely imaginary, and if the  
author has used names that may suggest a reference to living persons  
she has done so inadvertently. ...</p>  
</div>  
</front>
```

Example

```
<front>  
<div type="abstract">  
<div>  
<head> BACKGROUND:</head>  
<p>Food insecurity can put children at greater risk of obesity because  
of altered food choices and nonuniform consumption patterns.</p>  
</div>  
<div>  
<head> OBJECTIVE:</head>  
<p>We examined the association between obesity and both child-level  
food insecurity and personal food insecurity in US children.</p>  
</div>  
<div>  
<head> DESIGN:</head>  
<p>Data from 9,701 participants in the National Health and Nutrition  
Examination Survey, 2001-2010, aged 2 to 11 years were analyzed.  
Child-level food insecurity was assessed with the US Department of  
Agriculture's Food Security Survey Module based on eight  
child-specific questions. Personal food insecurity was assessed with  
five additional questions. Obesity was defined, using physical  
measurements, as body mass index (calculated as kg/m2) greater than  
or equal to the age- and sex-specific 95th percentile of the Centers  
for Disease Control and Prevention growth charts. Logistic  
regressions adjusted for sex, race/ethnic group, poverty level, and  
survey year were conducted to describe associations between obesity  
and food insecurity.</p>  
</div>  
<div>  
<head> RESULTS:</head>  
<p>Obesity was significantly associated with personal food insecurity  
for children aged 6 to 11 years (odds ratio=1.81; 95% CI 1.33 to  
2.48), but not in children aged 2 to 5 years (odds ratio=0.88; 95%  
CI 0.51 to 1.51). Child-level food insecurity was not associated  
with obesity among 2- to 5-year-olds or 6- to 11-year-olds.</p>  
</div>
```

```

<div>
  <head> CONCLUSIONS:</head>
  <p>Personal food insecurity is associated with an increased risk of
    obesity only in children aged 6 to 11 years. Personal
    food-insecurity measures may give different results than aggregate
    food-insecurity measures in children.</p>
</div>
</div>
</front>

<gap> indicates a point where material has been omitted in a transcription, whether for editorial reasons described in the TEI header, as part of sampling practice, or because the material is illegible, invisible, or inaudible. [3.4.3. Additions, Deletions, and Omissions]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source)) att.editLike (att.dimensions)

@reason gives the reason for omission

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: **cancelled**

deleted

editorial for features omitted from transcription due to editorial policy

illegible

inaudible

irrelevant

sampling

@hand in the case of text omitted from the transcription because of deliberate deletion by an identifiable hand, indicates the hand which made the deletion.

Deprecated will be removed on 2017-08-01

Status Optional

Datatype teidata.pointer

@agent in the case of text omitted because of damage, categorizes the cause of the damage, if it can be identified.

Status Optional

Datatype teidata.enumerated

Sample values include: **rubbing** damage results from rubbing of the leaf edges

mildew damage results from mildew on the leaf surface

smoke damage results from smoke

textstructure: back body div front text

transcr: supplied

May contain

core: desc

Note The <gap>, <unclear>, and core tag elements may be closely allied in use with the <damage> and <supplied> elements, available when using the additional tagset for transcription of primary sources. See section 11.3.3.2. Use of the gap, del, damage, unclear, and supplied Elements in Combination for discussion of which element is appropriate for which circumstance.

The <gap> tag simply signals the editors decision to omit or inability to transcribe a span of text. Other information, such as the interpretation that text was deliberately erased or covered, should be indicated using the relevant tags, such as in the case of deliberate deletion.

Example

```
<gap quantity="4" unit="chars"
  reason="illegible"/>
```

Example

```
<gap quantity="1" unit="essay"
  reason="sampling"/>
```

Example

```
<del>
  <gap atLeast="4" atMost="8" unit="chars"
    reason="illegible"/>
</del>
```

Example

```
<gap extent="several lines" reason="lost"/>
```

Schematron <sch:rule context="tei:gap-period">

tagdocs: att code eg egXML gi ident tag val

transcr: supplied

character data

Note The <head> element is used for headings at all levels; software which treats (e.g.) chapter headings, section headings, and list titles differently must determine the proper processing of a <head> element based on its structural position. A <head> occurring as the first element of a list is the title of that list; one occurring as the first element of a <div1> is the title of that chapter or section.

Example The most common use for the <head> element is to mark the headings of sections. In older writings, the headings or *incipits* may be rather longer than usual in modern works. If a section has an explicit ending as well as a heading, it should be marked as a <trailer>, as in this example:

```
<div1 n="I" type="book">
  <head>In the name of Christ here begins the first book of the
ecclesiastical history of
  Georgius Florentinus, known as Gregory, Bishop of Tours.</head>
  <div2 type="section">
    <head>In the name of Christ here begins Book I of the history.</head>
    <p>Proposing as I do ...</p>
    <p>From the Passion of our Lord until the death of Saint Martin four
hundred and twelve
      years passed.</p>
    <trailer>Here ends the first Book, which covers five thousand, five
hundred and ninety-six
      years from the beginning of the world down to the death of Saint
Martin.</trailer>
  </div2>
</div1>
```

Example When headings are not inline with the running text (see e.g. the heading "Secunda conclusio") they might however be encoded as if. The actual placement in the source document can be captured with the *place* attribute.

```
<div type="subsection">
  <head place="margin">Secunda conclusio</head>
  <p>
    <lb n="1251"/>
    <hi rend="large">Potencia: habitus: et actus: recipiunt speciem ab
    obiectis<supplied>.</supplied>
    </hi>
    <lb n="1252"/>Probatur sic. Omne importans necessariam habitudinem ad
    proprium
    [...]
  </p>
</div>
```

Example The <head> element is also used to mark headings of other units, such as lists:

```
With a few exceptions, connectives are equally
useful in all kinds of discourse: description, narration, exposition,
argument. <list rend="bulleted">
  <head>Connectives</head>
  <item>above</item>
  <item>accordingly</item>
  <item>across from</item>
  <item>adjacent to</item>
  <item>again</item>
  <item>
<!-- ... -->
  </item>
</list>
```

Schematron <sch:rule context="tei:head"> <sch:report test="matches(.,
'^\s*((figure|table|example|section))?\d', 'i')"> Headings are numbered and labeled
automatically, please remove the hard-coded label from the text. </sch:report>
</sch:rule>

Schematron <sch:rule context="tei:figure/tei:head"> <sch:assert test="@type =

Note In running prose, this element may be used for any kind of identifier in any formal language. It should not be used for element and attribute names in XML, for which the special elements <gi> and <att> are provided.

Example

```
<ident type="ns">http://www.tei-c.org/ns/Examples</ident>
```

Content model

<content> <textNode/></content>

Schema Declaration

element ident { att.global.attributes, text }

<idno> (identifier) supplies any form of identifier used to identify some object, such as a bibliographic item, a person, a title, an organization, etc. in a standardized way. [2.2.4. Publication, Distribution, Licensing, etc. 2.2.5. The Series Statement 3.11.2.4. Imprint, Size of a Document, and Reprint Information]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source)) att.data (@when, @notBefore, @notAfter, @from, @to))

@type categorizes the identifier, for example as an ISBN, Social Security number, etc.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Suggested values include: **ISBN** International Standard Book Number:
a 13- or (if assigned prior to 2007) 10-digit identifying number
assigned by the publishing industry to a published book or
similar item, registered with the International ISBN Agency.

ISSN International Standard Serial Number: an eight-digit number to uniquely identify a serial publication.

DOI Digital Object Identifier: a unique string of letters and numbers assigned to an electronic document.

URI Uniform Resource Identifier: a string of characters to uniquely identify a resource which usually contains indication of the means of accessing that resource, the name of its host, and its filepath.

VIAF A data number in the Virtual Internet Authority File assigned to link different names in catalogs around the world for the same entity.

ESTC English Short-Title Catalogue number: an identifying number assigned to a document in English printed in the British Isles or North America before 1801.

OCLC union catalog number in WorldCat representing a resource held by one or more of the member libraries in the global cooperative Online Computer Library Center.

character data

Note May contain simple prose or a sequence of chunks.

Whatever string of characters is used to label a list item in the copy text may be used as the value of the global *n* attribute, but it is not required that numbering be recorded explicitly. In ordered lists, the *n* attribute on the <item> element is by definition synonymous with the use of the <label> element to record the enumerator of the list item. In glossary lists, however, the term being defined should be given with the <label> element, not *n*.

Example

```

<list rend="numbered">
  <head>Here begin the chapter headings of Book IV</head>
  <item n="4.1">The death of Queen Clotild.</item>
  <item n="4.2">How King Lothar wanted to appropriate one third of the
Church revenues.</item>
  <item n="4.3">The wives and children of Lothar.</item>
  <item n="4.4">The Counts of the Bretons.</item>
  <item n="4.5">Saint Gall the Bishop.</item>
  <item n="4.6">The priest Cato.</item>
  <item> ...</item>
</list>

```

Content model

```

<content>
  <macroRef key="macro.specialPara"/>
</content>

```

Schema Declaration

```

element item { att.global.attributes, macro.specialPara }

```

<keywords> contains a list of keywords or phrases identifying the topic or nature of a text. [2.4.3. The Text Classification]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source))

@scheme identifies the controlled vocabulary within which the set of keywords concerned is defined, for example by a **<taxonomy>** element, or by some other resource.

Status Optional

Datatype teidata.pointer

Content model: textClass

May contain

core: list term

Note Each individual keyword (including compound subject headings) should be supplied as a <term> element directly within the <keywords> element. An alternative usage, in which each <term> appears within a <item> inside a <list> is permitted for backwards compatibility, but is deprecated.

If no control list exists for the keywords used, then no value should be supplied for the *scheme* attribute.

Example

```

<keywords scheme="http://classificationweb.net">
  <term>Babbage, Charles</term>
  <term>Mathematicians - Great Britain - Biography</term>
</keywords>

```

Example

```
<keywords>
  <term>Fermented beverages</term>
  <term>Central Andes</term>
  <term>Schinus molle</term>
  <term>Molle beer</term>
  <term>Indigenous peoples</term>
  <term>Ethnography</term>
  <term>Archaeology</term>
</keywords>
```

Content model

```
<content>
  <alternate>
    <elementRef key="term" minOccurs="1"
      maxOccurs="unbounded"/>
    <elementRef key="list"/>

character data

Example Labels are commonly used for the headwords in glossary lists; note the use of the global *xml:lang* attribute to set the default language of the glossary list to Middle English, and identify the glosses and headings as modern English or Latin:

```
<list type="gloss" xml:lang="enm">
  <head xml:lang="en">Vocabulary</head>
  <headLabel xml:lang="en">Middle English</headLabel>
  <headItem xml:lang="en">New English</headItem>
  <label>nu</label>
  <item xml:lang="en">now</item>
  <label>lhude</label>
  <item xml:lang="en">loudly</item>
  <label>bloweth</label>
  <item xml:lang="en">blooms</item>
  <label>med</label>
  <item xml:lang="en">meadow</item>
  <label>wude</label>
  <item xml:lang="en">wood</item>
  <label>awe</label>
  <item xml:lang="en">ewe</item>
  <label>lhouth</label>
  <item xml:lang="en">lows</item>
  <label>sterteth</label>
  <item xml:lang="en">bounds, frisks (cf. <cit>
    <ref>Chaucer, K.T.644</ref>
    <quote>a courser, <term>sterting</term>as the fyr</quote>
  </cit>
</item>
  <label>verteth</label>
  <item xml:lang="la">pedit</item>
  <label>murie</label>
  <item xml:lang="en">merrily</item>
  <label>swik</label>
  <item xml:lang="en">cease</item>
  <label>naver</label>
  <item xml:lang="en">never</item>
</list>
```

Example Labels may also be used to record explicitly the numbers or letters which mark list items in ordered lists, as in this extract from Gibbon's *Autobiography*. In this usage the <label> element is synonymous with the *n* attribute on the <item> element:

```
I will add two facts, which have seldom occurred
in the composition of six, or at least of five quartos.
<list rend="runon" type="ordered">
  <label>(1)</label>
  <item>My first rough manuscript, without any intermediate copy, has been
sent to the press.</item>
  <label>(2) </label>
  <item>Not a sheet has been seen by any human eyes, excepting those of the
author and the
printer: the faults and the merits are exclusively my own.</item>
</list>
```

Example Labels may also be used for other structured list items, as in this extract from the journal of Edward Gibbon:

```
<list type="gloss">
  <label>March 1757.</label>
  <item>I wrote some critical observations upon Plautus.</item>
```

```
<label>March 8th.</label>
<item>I wrote a long dissertation upon some lines of Virgil.</item>
<label>June.</label>
<item>I saw Mademoiselle Curchod – <quote xml:lang="la">Omnia vincit amor,
et nos cedamus
    amori.</quote>
</item>
<label>August.</label>
<item>I went to Crassy, and staid two days.</item>
</list>
```

Note that the `<label>` might also appear within the `<item>` rather than as its sibling. Though syntactically valid, this usage is not recommended TEI practice.

Example Labels may also be used to represent a label or heading attached to a paragraph or sequence of paragraphs not treated as a structural division, or to a group of verse lines. Note that, in this case, the `<label>` element appears *within* the `<p>` or `<lg>` element, rather than as a preceding sibling of it.

```
<p>[...]
<lb/>& n'entrer en mauuais & mal-heu-
<lb/>r   mefnage. Or des que le confente-
<lb/>ment des parties y eft le mariage eft
<lb/> arreft  , quoy que de faict il ne foit
<label place="margin">Puiffance maritale
    entre les Romains.</label>
<lb/> conform  . Depuis la conforma-
<lb/>tion du mariage la femme eft fous
<lb/> la puiffance du mary, s'il n'eft efcla-
<lb/>ue ou enfant de famille : car en ce
<lb/> cas, la femme, qui a   pou   vn en-
<lb/>fant de famille, eft fous la puiffance
[...]</p>
```

In this example the text of the label appears in the right hand margin of the original source, next to the paragraph it describes, but approximately in the middle of it. If so desired the *type* attribute may be used to distinguish different categories of label.

Content model

namesdates: affiliation forename orgName person roleName surname

tagdocs: eg

textstructure: back body div front text

transcr: supplied

May contain Empty element

Note By convention, <lb> elements should appear at the point in the text where a new line starts. The *n* attribute, if used, indicates the number or other value associated with the text between this point and the next <lb> element, typically the sequence number of the line within the page, or other appropriate unit. This element is

intended to be used for marking actual line breaks on a manuscript or printed page, at the point where they occur; it should not be used to tag structural units such as lines of verse (for which the <l> element is available) except in circumstances where structural units cannot otherwise be marked.

The *type* attribute may be used to characterize the line break in any respect. The more specialized attributes *break*, *ed*, or *edRef* should be preferred when the intent is to indicate whether or not the line break is word-breaking, or to note the source from which it derives.

Example This example shows typographical line breaks within metrical lines, where they occur at different places in different editions:

```
<l>Of Mans First Disobedience,<lb ed="1674"/> and<lb ed="1667"/> the
Fruit</l>
<l>Of that Forbidden Tree, whose<lb ed="1667 1674"/> mortal tast</l>
<l>Brought Death into the World,<lb ed="1667"/> and all<lb ed="1674"/> our
woe,</l>
```

Example This example encodes typographical line breaks as a means of preserving the visual appearance of a title page. The *break* attribute is used to show that the line break does not (as elsewhere) mark the start of a new word.

```
<titlePart>
  <lb/>With Additions, ne-<lb break="no"/>ver before Printed.
</titlePart>
```

```

<list> contains any sequence of items organized as a list. [3.7. Lists]

Module core

Attributes *Attributes*att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
att.global.rendition (~~rend~~, @rendition) att.global.responsibility (@cert, @resp)
att.global.source (@source)

@rend (rendition) describes the way the list should be rendered.

Derived from att.global.rendition

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by
whitespace

Legal values are: **bulleted** (A bulleted list) Bulleted lists will appear
with each item preceded by a leading dot.

inline (An inline list) Inline lists appear within a paragraph of
ordinary text; list items do not start on a new line, but follow
immediately from the preceding text or item. The value "inline"
may be combined with another value; for example, "ordered
inline" means that the list will be rendered inline, but each item

will be preceded by a number in parentheses: (1) first item (2) second item, and so on.

ordered (A numbered list) Items in a numbered list will be preceded by a number. If the list is inline, then the number will be enclosed in parentheses, but if it is a block-level list (the default), the number will be followed by a period.

simple (A simple list (no bullets or numbers)) Items in a simple list will be rendered with no bullet or preceding number at all.

@type describes the nature of the items in the list.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Legal values are: **gloss**

Note Previous versions of these Guidelines recommended the use of *type* on <list> to encode the rendering or appearance of a list (whether it was bulleted, numbered, etc.). The current recommendation is to use the *rend* or *style* attributes for these aspects of a list, while using *type* for the more appropriate task of characterizing the nature of the content of a list.

Note The formal syntax of the element declarations allows <label> tags to be omitted from lists tagged <list type="gloss">; this is however a semantic error.

character data

Example In the following example, the translator has supplied a footnote containing an explanation of the term translated as "painterly":

```
And yet it is not only
in the great line of Italian renaissance art, but even in the
painterly <note place="bottom" type="gloss"
  resp="#MDMH">
  <term xml:lang="de">Malerisch</term>. This word has, in the German, two
  distinct meanings, one objective, a quality residing in the object,
  the other subjective, a mode of apprehension and creation. To avoid
  confusion, they have been distinguished in English as
  <mentioned>picturesque</mentioned> and
  <mentioned>painterly</mentioned> respectively.
</note> style of the
Dutch genre painters of the seventeenth century that drapery has this
psychological significance.

<!-- elsewhere in the document -->
<respStmt xml:id="MDMH">
  <resp>translation from German to English</resp>
  <name>Hottinger, Marie Donald Mackie</name>
</respStmt>
```

For this example to be valid, the code MDMH must be defined elsewhere, for example by means of a responsibility statement in the associated TEI header.

Example The global *n* attribute may be used to supply the symbol or number used to mark the note's point of attachment in the source text, as in the following example:

```
Mevorakh b. Saadya's mother, the matriarch of the
family during the second half of the eleventh century,
<note n="126" anchored="true"> The
alleged mention of Judah Nagid's mother in a letter from 1071 is, in fact,
a reference to
Judah's children; cf. above, nn. 111 and 54. </note> is well known from
Geniza documents
published by Jacob Mann.
```

However, if notes are numbered in sequence and their numbering can be reconstructed automatically by processing software, it may well be considered unnecessary to record the note numbers.

Schematron <sch:rule context="tei:note">
 <sch:assert test="not(following-sibling::text()[1][matches(., '\[.,\.;!?\]\']')]">

<num> (number) contains a number, written in any form. [3.5.3. Numbers and Measures]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source))

@type indicates the type of numeric value. In jTEI, we particularly use
 num[@type='ordinal'] for e.g. 21st or 2nd; in rendering, this results in the
 non-numeric suffix to the number being output as superscript. Note,
 however, that ordinals for centuries should be spelled out, not written using
 digits (nineteenth century, not 19th century).

Status Optional

Datatype teidata.enumerated

Suggested values include: **cardinal** absolute number, e.g. 21, 21.5

ordinal ordinal number, e.g. 21st

fraction fraction, e.g. one half or three-quarters

percentage a percentage

Note If a different typology is desired, other values can be used for this
 attribute.

@value supplies the value of the number in standard form.

Status Optional

Datatype teidata.numeric

Values a numeric value.

Note The standard form used is defined by the TEI datatype
 data.numeric.

```

<particDesc> (participation description) describes the identifiable speakers, voices, or other participants in any kind of text or other persons named or otherwise referred to in a text, edition, or metadata. [15.2. Contextual Information]

Module corpus

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
(att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
(att.global.source (@source))

Member of model.profileDescPart

Contained by

header: profileDesc

May contain

core: p

namesdates: listPerson person

Note May contain a prose description organized as paragraphs, or a structured list of persons and person groups, with an optional formal specification of any relationships amongst them.

Example

```
<particDesc>
  <listPerson>
    <person xml:id="P-1234" sex="2" age="mid">
      <p>Female informant, well-educated, born in
        Shropshire UK, 12 Jan 1950, of unknown occupation. Speaks French
        fluently.
        Socio-Economic status B2.</p>
    </person>
    <person xml:id="P-4332" sex="1">
      <persName>
        <surname>Hancock</surname>
        <forename>Antony</forename>
        <forename>Aloysius</forename>
        <forename>St John</forename>
      </persName>
      <residence notAfter="1959">
        <address>
          <street>Railway Cuttings</street>
          <settlement>East Cheam</settlement>
        </address>
      </residence>
      <occupation>comedian</occupation>
    </person>
    <listRelation>
      <relation type="personal" name="spouse"
        mutual="#P-1234 #P-4332"/>
    </listRelation>
  </listPerson>
</particDesc>
```

This example shows both a very simple person description, and a very detailed one, using some of the more specialized elements from the module for Names and Dates.

Content model

```

    <elementRef key="listOrg"/>
  </alternate>
</alternate>
</content>

```

Schema Declaration

```

element particDesc
{
  att.global.attributes,
  ( model.pLike+ | ( model.personLike | listPerson | listOrg )+ )
}

```

<person> provides information about an identifiable individual, for example a participant in a language interaction, or a person referred to in a historical source. [13.3.2. The Person Element 15.2.2. The Participant Description]

Module namesdates

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space) (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp)) (att.global.source (@source)) att.editLike (att.dimensions)

@role specifies a primary role or classification for the person.

Status Optional

Datatype 1–∞ occurrences of teidata.enumerated separated by whitespace

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as artist, employer, author, relative, or servant, each of which should be associated with a definition. Such local definitions will typically be provided by a <vallist> element in the project schema specification.

@sex specifies the sex of the person.

Status Optional

Datatype 1–∞ occurrences of teidata.sex separated by whitespace

Note Values for this attribute may be locally defined by a project, or may refer to an external standard, such as vCard's sex property <http://microformats.org/wiki/gender-formats> (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 *Representation of Human Sexes* [http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004\(E_F\).zip](http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip) (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH's *Recommendations for Inclusive Data Collection of Trans People* <http://transhealth.ucsf.edu/trans?page=lib-data-collection>.

@age specifies an age group for the person.

Status Optional

Datatype teidata.enumerated

A SUMMARY OF ELEMENTS AND THEIR RENDITION

Note Values for this attribute may be locally defined by a project, using arbitrary keywords such as infant, child, teen, adult, or senior, each of which should be associated with a definition. Such local definitions will typically be provided by a `<valList>` element in the project schema specification.

Member of model.personLike

Schema Declaration

```
element quote { att.global.attributes, macro.specialPara }
```

<ref> (reference) defines a reference to another location, possibly modified by additional text or comment. [3.6. Simple Links and Cross-References 16.1. Links]

Module core

Attributes Attributes att.global (*@xml:id*, *@n*, *@xml:lang*, *@xml:base*, *@xml:space*)
(att.global.rendition (*@rend*, *@rendition*)) (att.global.responsibility (*@cert*, *@resp*))
(att.global.source (*@source*))

@target specifies the destination of the reference by supplying one or more URI

References

Derived from att.pointing

Status Required

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

@type characterizes the element in some sense, using any convenient classification scheme or typology.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Legal values are: **crossref** (A cross-reference (reference to another part of the article).) To link to another part of your article, use <ref type="crossref">, and point to the *xml:id* value of the target location: <ref type="crossref" target="#intro">.

bibl (A bibliographic reference (reference to an entry in the bibliography).) To link to a bibliographic description in the bibliography, use <ref type="bibl">, and point to the *xml:id* value of the target location: <ref type="bibl" target="#ide88">.

 <sqf:fix id="bibltype.add"> <sqf:description> <sqf:title>Add
 @type='bibl'</sqf:title> </sqf:description>
 <sqf:add match="." node-type="attribute" target="type" select="'bibl'"/>
 </sqf:fix> </sch:rule>`

Schematron `<s:report test="@target and @cRef">Only one of the attributes @target'
 and @cRef' may be supplied on <s:name/> </s:report>`

Content model

```
<content>
  <macroRef key="macro.paraContent"/>
</content>
```

Schema Declaration

```
element ref
{
  att.global.attributes,
  attribute target { list { + } },
  attribute type { "crossref" | "bibl" }?,
  macro.paraContent}

```

<rendition> supplies information about the rendition or appearance of one or more elements in the source text. [2.3.4. The Tagging Declaration]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source))

@scheme identifies the language used to describe the rendition.

Derived from att.styleDef

Status Optional

Datatype teidata.enumerated

Legal values are: **css**

@selector contains a selector or series of selectors specifying the elements to which the contained style description applies, expressed in the language specified in the *scheme* attribute.

Status Optional

Datatype teidata.text

```
<rendition scheme="css"
  selector="text, front, back, body, div, p, ab">
display: block;
</rendition>
<rendition scheme="css"
  selector="*[rend*=italic]"> font-style: italic;
</rendition>
```

Note Since the default value of the *scheme* attribute is assumed to be CSS, the default expectation for this attribute, in the absence of *scheme*, is that CSS selector syntax will be used.

Note While *rendition* is used to point from an element in the transcribed source to a <rendition> element in the header which describes how it appears, the *selector* attribute allows the encoder to point in the other direction: from a <rendition> in the header to a collection of elements which all share the same renditional features. In both cases, the intention is to record the appearance of the source text, not to prescribe any particular output rendering.

May contain Character data only

Example

```
Mark the start of each italicised phrase with a
<tag>hi rend="it"</tag> tag, and its end with a <tag type="end">hi</tag>
tag.
<tag type="comment">Example updated on 2008-04-05</tag>
```

Schematron <sch:rule context="tei:tag"> <sch:assert test="not(matches(.,
'^[<?!-]|[/?\\-]\$'))"> Tag delimiters such as angle brackets and tag-closing slashes
are not allowed for <sch:name/>: they are completed at processing time via XSLT.
</sch:assert> </sch:rule>

Content model <content> <textNode/></content>

Schema Declaration

```
element tag
{
  att.global.attributes,
  attribute type { "start" | "end" | "empty" | "pi" | "comment" | "ms" }?,
  attribute scheme { text }?,
  text
}
```

<tagsDecl> (tagging declaration) provides detailed information about the tagging applied to a document. [2.3.4. The Tagging Declaration 2.3. The Encoding Description]

Module header

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source))

@partial indicates whether the element types listed exhaustively include all those found within <text>, or represent only a subset.

Status Recommended

Datatype teidata.truthValue

Note TEI recommended practice is to specify this attribute. When the **<tagUsage>** elements inside <tagsDecl> are used to list each of the element types in the associated <text>, the value should be given as false. When the **<tagUsage>** elements inside <tagsDecl> are used to provide usage information or default renditions for only a subset of the elements types within the associated <text>, the value should be true.

Member of model.encodingDescPart

Contained by

header: encodingDesc

May contain

header: rendition

Example

```
<tagsDecl partial="true">
  <rendition xml:id="rend-it" scheme="css"
    selector="emph hi name title">font-style: italic;</rendition>
  <namespace name="http://www.tei-c.org/ns/1.0">
    <tagUsage gi="hi" occurs="467"/>
    <tagUsage gi="title" occurs="45"/>
  </namespace>
  <namespace name="http://docbook.org/ns/docbook">
    <tagUsage gi="para" occurs="10"/>
  </namespace>
</tagsDecl>
```

If the *partial* attribute were not specified here, the implication would be that the document in question contains only <hi>, <title>, and <para> elements.

Content model

```

character data

Note When this element appears within an <index> element, it is understood to supply the form under which an index entry is to be made for that location. Elsewhere, it is understood simply to indicate that its content is to be regarded as a technical or specialised term. It may be associated with a <gloss> element by means of its *ref* attribute; alternatively a <gloss> element may point to a <term> element by means of its *target* attribute.

In formal terminological work, there is frequently discussion over whether terms must be atomic or may include multi-word lexical items, symbolic designations, or phraseological units. The <term> element may be used to mark any of these. No position is taken on the philosophical issue of what a term can be; the looser definition simply allows the <term> element to be used by practitioners of any persuasion.

As with other members of the att.canonical class, instances of this element occurring in a text may be associated with a canonical definition, either by means of a URI (using the *ref* attribute), or by means of some system-specific code value (using the *key* attribute). Because the mutually exclusive *target* and *cRef* attributes overlap with the function of the *ref* attribute, they are deprecated and may be removed at a subsequent release.

Example

A computational device that infers structure from grammatical strings of words is known as a <term>parser</term>, and much of the history of NLP over the last 20 years has been occupied with the design of parsers.

Example

We may define `<term xml:id="TDPV1" rend="sc">discoursal point of view</term>` as
`<gloss target="#TDPV1">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss>`

Example

We may define `<term ref="#TDPV2" rend="sc">discoursal point of view</term>` as
`<gloss xml:id="TDPV2">the relationship, expressed through discourse structure, between the implied author or some other addresser, and the fiction.</gloss>`

Example

We discuss Leech's concept of
`<term ref="myGlossary.xml#TDPV2" rend="sc">discoursal point of view</term>`
 below.

Content model

}

```

<title> contains a title for any kind of work. [3.11.2.2. Titles, Authors, and Editors 2.2.1. The Title Statement 2.2.5. The Series Statement]

Module core

Attributes Attributes att.global (@xml:id, @n, @xml:lang, @xml:base, @xml:space)
 (att.global.rendition (@rend, @rendition)) (att.global.responsibility (@cert, @resp))
 (att.global.source (@source)) att.dataable (att.dataable.w3c (@when, @notBefore,
 @notAfter, @from, @to))

@type classifies the title according to some convenient typology.

Derived from att.typed

Status Optional

Datatype teidata.enumerated

Legal values are: **main** (The main title of your article.) Academic articles often have a main title followed by a subtitle (sometimes with a colon separating them). If you have two such components in your article title, then in the <titleStmt>, use <title type="main"> and <title type="sub"> to encode the two components of your title.

sub (The subtitle of your article.) Academic articles often have a main title followed by a subtitle (sometimes with a colon separating them). If you have two such components in your article title, then in the <titleStmt>, use <title type="main"> and <title type="sub"> to encode the two components of your title.

Note This attribute is provided for convenience in analysing titles and processing them according to their type; where such specialized processing is not necessary, there is no need for such analysis, and the entire title, including subtitles and any parallel titles, may be enclosed within a single <title> element.

@level indicates the bibliographic level for a title, that is, whether it identifies an article, book, journal, series, or unpublished material.

Status Optional

Datatype teidata.enumerated

Legal values are: **a** (analytic) the title applies to an analytic item, such as an article, poem, or other work published as part of a larger item.

m (monographic) the title applies to a monograph such as a book or other item considered to be a distinct publication, including single volumes of multi-volume works

j (journal) the title applies to any serial or periodical publication such as a journal, magazine, or newspaper

s (series) the title applies to a series of otherwise distinct publications such as a collection

u (unpublished) the title applies to any unpublished material (including theses and dissertations unless published by a commercial press)

Note The level of a title is sometimes implied by its context: for example, a title appearing directly within an **<analytic>** element is *ipso facto* of level a, and one appearing within a **<series>** element of level s. For this reason, the *level* attribute is not required in contexts where its value can be unambiguously inferred. Where it is supplied in such contexts, its value should not contradict the value implied by its parent element.

A.3 Attribute classes

att.ascribed provides attributes for elements representing speech or action that can be ascribed to a specific individual. [3.3.3. Quotation 8.3. Elements Unique to Spoken Texts]

Module tei

Members change q

Attributes Attributes

@who indicates the person, or group of people, to whom the element content is ascribed.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

In the following example from Hamlet, speeches (<sp>) in the body of the play are linked to <castItem> elements in the

<castList> using the *who* attribute. <castItem type="role">

```
<role xml:id="Barnardo">Barnardo</role>
```

```
</castItem>
```

```
<castItem type="role">
```

```
<role xml:id="Francisco">Francisco</role>
```

```
<roleDesc>a soldier</roleDesc>
```

```
</castItem>
```

```
<!-- ... -->
```

```
<sp who="#Barnardo">
```

```
<speaker>Barnardo</speaker>
```

```
<l n="1">Who's there?</l>
```

```
</sp>
```

```
<sp who="#Francisco">
```

```
<speaker>Francisco</speaker>
```

```
<l n="2">Nay, answer me: stand, and unfold yourself.</l>
```

```
</sp>
```

Note For transcribed speech, this will typically identify a participant or participant group; in other contexts, it will point to any identified <person> element.

att.datable provides attributes for normalization of elements that contain dates, times, or datable events. [3.5.4. Dates and Times 13.3.6. Dates and Times]

Module tei

Members change date idno licence title

Attributes Attributes att.dateable.w3c (@when, @notBefore, @notAfter, @from, @to)

Note This superclass provides attributes that can be used to provide normalized values of temporal information. By default, the attributes from the att.dateable.w3c class are provided. If the module for names & dates is loaded, this class also provides attributes from the att.dateable.iso and att.dateable.custom classes. In general, the possible values of attributes restricted to the W3C datatypes form a subset of those values available via the ISO 8601 standard. However, the greater expressiveness of the ISO datatypes may not be needed, and there exists much greater software support for the W3C datatypes.

att.dateable.w3c provides attributes for normalization of elements that contain dateable events conforming to the W3C *XML Schema Part 2: Datatypes Second Edition*.
[3.5.4. Dates and Times 13.3.6. Dates and Times]

Module tei

Members att.dateable[change date idno licence title]

Attributes Attributes

@when supplies the value of the date or time in a standard form, e.g.

yyyy-mm-dd.

Status Optional

Datatype teidata.temporal.w3c

Examples of W3C date, time, and date & time formats. <p>

<date when="1945-10-24">24 Oct 45</date>

<date when="1996-09-24T07:25:00Z">September 24th, 1996 at 3:25 in the morning</date>

Schematron <sch:rule context="tei:*[@to]"> <sch:report test="@notAfter"

role="nonfatal">The @to and @notAfter attributes cannot be used

together.</sch:report> </sch:rule>

Example

```
<date from="1863-05-28" to="1863-06-01">28 May through 1 June 1863</date>
```

Note The value of these attributes should be a normalized representation of the date, time, or combined date & time intended, in any of the standard formats specified by *XML Schema Part 2: Datatypes Second Edition*, using the Gregorian calendar.

The most commonly-encountered format for the date portion of a temporal attribute is **yyyy-mm-dd**, but **yyyy**, **--mm**, **---dd**, **yyyy-mm**, or **--mm-dd** may also be used. For the time part, the form **hh:mm:ss** is used.

Note that this format does not currently permit use of the value 0000 to represent the year 1 BCE; instead the value -0001 should be used.

att.dimensions provides attributes for describing the size of physical objects.

Module tei

Members att.editLike[affiliation date gap name orgName person supplied]

Attributes Attributes

att.divLike provides attributes common to all elements which behave in the same way as divisions. [4. Default Text Structure]

Module tei

Members div

Attributes Attributes

att.editLike provides attributes describing the nature of an encoded scholarly intervention or interpretation of any kind. [3.4. Simple Editorial Changes 10.3.1. Origination 13.3.2. The Person Element 11.3.1.1. Core Elements for Transcriptional Work]

Module tei

Members affiliation date gap name orgName person supplied

Attributes Attributes att.dimensions

Note The members of this attribute class are typically used to represent any kind of editorial intervention in a text, for example a correction or interpretation, or to date or localize manuscripts etc.

Note Each pointer on the *source* (if present) corresponding to a witness or witness group should reference a bibliographic citation such as a **<witness>**, **<msDesc>**, or **<bibl>** element, or another external bibliographic citation, documenting the source concerned.

att.global provides attributes common to all elements in the TEI encoding scheme. [1.3.1.1. Global Attributes]

Module tei

Members TEI abbr affiliation appInfo application att author availability back bibl biblScope body catRef cell change cit classCode code date desc div edition editor eg egXML email emph encodingDesc figure fileDesc foreign forename front gap gi graphic head hi ident idno item keywords label langUsage language lb licence listBibl listChange listPerson mentioned name note num orgName p particDesc person profileDesc projectDesc ptr pubPlace publicationStmt publisher q quote ref rendition revisionDesc roleName row series seriesStmt soCalled sourceDesc supplied surname table tag tagsDecl teiHeader term text textClass title titleStmt val

Attributes Attributes att.global.rendition (*@rend*, *@rendition*) att.global.responsibility (*@cert*, *@resp*) att.global.source (*@source*)

@xml:id (identifier) provides a unique identifier for the element bearing the attribute.

Status Optional

Datatype ID

Note The *xml:id* attribute may be used to specify a canonical reference for an element; see section 3.10. Reference Systems.

@n (number) gives a number (or other label) for an element, which is not necessarily unique within the document.

Status Optional

Datatype teidata.text

Note The value of this attribute is always understood to be a single token, even if it contains space or other punctuation characters, and need not be composed of numbers only. It is typically used to specify the numbering of chapters, sections, list items, etc.; it may also be used in the specification of a standard reference system for the text.

@xml:lang (language) indicates the language of the element content using a tag generated according to BCP 47.

Status Optional

Datatype teidata.language

`<p> ... The consequences of this rapid depopulation were the loss of the last <foreign xml:lang="rap">ariki</foreign> or chief (Routledge 1920:205,210) and their connections to ancestral territorial organization.</p>`

Note The `xml:lang` value will be inherited from the immediately enclosing element, or from its parent, and so on up the document hierarchy. It is generally good practice to specify `xml:lang` at the highest appropriate level, noticing that a different default may be needed for the `teiHeader` from that needed for the associated resource element or elements, and that a single TEI document may contain texts in many languages.

The authoritative list of registered language subtags is maintained by IANA and is available at <http://www.iana.org/assignments/language-subtag-registry>. For a good general overview of the construction of language tags, see <http://www.w3.org/International/articles/language-tags/>, and for a practical step-by-step guide, see <https://www.w3.org/International/questions/qa-choosing-language-tags.en.php>. The value used must conform with BCP 47. If the value is a private use code (i.e., starts with `x-` or contains `-x-`), a `<language>` element with a matching value for its *ident* attribute should be supplied in the TEI header to document this value. Such documentation may also optionally be supplied for non-private-use codes, though these must remain consistent with their (IETF) Internet Engineering Task Force definitions.

`@xml:base` provides a base URI reference with which applications can resolve relative URI references into absolute URI references.

Status Optional

Datatype `teidata.pointer`

```
<div type="bibl">
  <head>Bibliography</head>
  <listBibl xml:base="http://www.lib.ucdavis.edu/BWRP/Works/">
    <bibl>

      </author>
      <ref target="LandLVow0f.sgm">
        <title>The Vow of the Peacock</title>
      </ref>
    </bibl>
    <bibl>
      <author>
        <name>Compton, Margaret Clephane</name>
      </author>
      <ref target="NortMIrene.sgm">
        <title>Irene, a Poem in Six Cantos</title>
      </ref>
    </bibl>
    <bibl>
      <author>
        <name>Taylor, Jane</name>
      </author>
      <ref target="TaylJEssay.sgm">
        <title>Essays in Rhyme on Morals and Manners</title>
      </ref>
    </bibl>
  </listBibl>
</div>
```

```

    </listBibl>
  </div>

```

@xml:space signals an intention about how white space should be managed by applications.

Status Optional

Datatype teidata.enumerated

Legal values are: **default** signals that the application's default white-space processing modes are acceptable

preserve indicates the intent that applications preserve all white space

Note The XML specification provides further guidance on the use of this attribute. Note that many parsers may not handle xml:space correctly.

att.global.rendition provides rendering attributes common to all elements in the TEI encoding scheme. [1.3.1.1.3. Rendition Indicators]

Module tei

Members att.global[TEI abbr affiliation appInfo application att author availability back bibl biblScope body catRef cell change cit classCode code date desc div edition editor eg egXML email emph encodingDesc figure fileDesc foreign forename front gap gi graphic head hi ident idno item keywords label langUsage language lb licence listBibl listChange listPerson mentioned name note num orgName p particDesc person profileDesc projectDesc ptr pubPlace publicationStmt publisher q quote ref rendition revisionDesc roleName row series seriesStmt soCalled sourceDesc supplied surname table tag tagsDecl teiHeader term text textClass title titleStmt val]

Attributes Attributes

@rend (rendition) indicates how the element in question was rendered or presented in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.word separated by whitespace

```

<head rend="align(center) case(allcaps)">
  <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle,
<lb/>On Her <lb/>
  <hi rend="case(mixed)">New Blazing-World</hi>.
</head>

```

Note These Guidelines make no binding recommendations for the values of the *rend* attribute; the characteristics of visual presentation vary too much from text to text and the decision to record or ignore individual characteristics varies too much from project to project. Some potentially useful conventions are noted from time to time at appropriate points in the Guidelines. The values of the *rend* attribute are a set of sequence-indeterminate individual tokens separated by whitespace.

@rendition points to a description of the rendering or presentation used for this element in the source text.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

```

<head rendition="#ac #sc">
  <lb/>To The <lb/>Duchesse <lb/>of <lb/>Newcastle, <lb/>On
Her

```

```

<lb/>
  <hi rendition="#normal">New Blazing-World</hi>.
</head>
<!-- elsewhere... -->
<rendition xml:id="sc"
  scheme="css">font-variant: small-caps</rendition>
<rendition xml:id="normal"
  scheme="css">font-variant: normal</rendition>
<rendition xml:id="ac"
  scheme="css">text-align: center</rendition>

```

Note The *rendition* attribute is used in a very similar way to the *class* attribute defined for XHTML but with the important distinction that its function is to describe the appearance of the source text, not necessarily to determine how that text should be presented on screen or paper.

If *rendition* is used to refer to a style definition in a formal language like CSS, it is recommended that it not be used in conjunction with *rend*. Where both *rendition* and *rend* are supplied, the latter is understood to override or complement the former.

Each URI provided should indicate a *<rendition>* element defining the intended rendition in terms of some appropriate style language, as indicated by the *scheme* attribute.

att.global.responsibility provides attributes indicating the agent responsible for some aspect of the text, the markup or something asserted by the markup, and the degree of certainty associated with it. [1.3.1.1.4. Sources, certainty, and responsibility 3.4. Simple Editorial Changes 11.3.2.2. Hand, Responsibility, and Certainty Attributes 17.3. Spans and Interpretations 13.1.1. Linking Names and Their Referents]

Module *tei*

Members att.global[TEI abbr affiliation appInfo application att author availability back bibl biblScope body catRef cell change cit classCode code date desc div edition editor eg egXML email emph encodingDesc figure fileDesc foreign forename front gap gi graphic head hi ident idno item keywords label langUsage language lb licence listBibl listChange listPerson mentioned name note num orgName p particDesc person profileDesc projectDesc ptr pubPlace publicationStmt publisher q quote ref rendition revisionDesc roleName row series seriesStmt soCalled sourceDesc supplied surname table tag tagsDecl teiHeader term text textClass title titleStmt val]

Attributes Attributes

@cert (certainty) signifies the degree of certainty associated with the intervention or interpretation.

Status Optional

Datatype teidata.probCert

@resp (responsible party) indicates the agency responsible for the intervention or interpretation, for example an editor or transcriber.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note To reduce the ambiguity of a *resp* pointing directly to a person or organization, we recommend that *resp* be used to point not to an agent (*<person>* or *<org>*) but to a *<respStmt>*, *<author>*, *<editor>* or similar element which clarifies the exact role played by

the agent. Pointing to multiple `<respStmt>`s allows the encoder to specify clearly each of the roles played in part of a TEI file (creating, transcribing, encoding, editing, proofing etc.).

Example

```
Blessed are the
<choice>
  <sic>cheesemakers</sic>
  <corr resp="#editor" cert="high">peacemakers</corr>
</choice>: for they shall be called the children of God.
```

Example

```
<!-- in the <text> ... --><lg>
<!-- ... -->
<l>Punkes, Panders, bafe extortionizing
  sla<choice>
    <sic>n</sic>
    <corr resp="#JENS1_transcriber">u</corr>
  </choice>es,</l>
<!-- ... -->
</lg>
<!-- in the <teiHeader> ... -->
<!-- ... -->
<respStmt xml:id="JENS1_transcriber">
  <resp when="2014">Transcriber</resp>
  <name>Janelle Jenstad</name>
</respStmt>
```

att.global.source provides an attribute used by elements to point to an external source. [1.3.1.1.4. Sources, certainty, and responsibility 3.3.3. Quotation 8.3.4. Writing]

Module tei

Members att.global[TEI abbr affiliation appInfo application att author availability back bibl biblScope body catRef cell change cit classCode code date desc div edition editor eg egXML email emph encodingDesc figure fileDesc foreign forename front gap gi graphic head hi ident idno item keywords label langUsage language lb licence listBibl listChange listPerson mentioned name note num orgName p particDesc person profileDesc projectDesc ptr pubPlace publicationStmt publisher q quote ref rendition revisionDesc roleName row series seriesStmt soCalled sourceDesc supplied surname table tag tagsDecl teiHeader term text textClass title titleStmt val]

Attributes Attributes

@source specifies the source from which some aspect of this element is drawn.

Status Optional

Datatype 1–∞ occurrences of teidata.pointer separated by whitespace

Note The *source* attribute points to an external source. When used on elements describing schema components such as `<schemaSpec>` or `<moduleRef>` it identifies the source from which declarations for the components of the object being defined may be obtained.

On other elements it provides a pointer to the bibliographical source from which a quotation or citation is drawn.

In either case, the location may be provided using any form of URI,

for example an absolute URI, a relative URI, or private scheme URI that is expanded to an absolute URI as documented in a **<prefixDef>**.

If more than one location is specified, the default assumption is that the required source should be obtained by combining the resources indicated.

Example

```
<p>
<!-- ... --> As Willard McCarty (<bibl xml:id="mcc_2012">2012, p.2</bibl>)
tells us, <quote source="#mcc_2012">'Collaboration' is a problematic and
term.</quote>
<!-- ... -->
</p>
```

Example

```
<p>
<!-- ... -->
<quote source="#chicago_15_ed">Grammatical theories are in flux, and the
more we learn, the
less we seem to know.</quote>
<!-- ... -->
</p>
<!-- ... -->
<bibl xml:id="chicago_15_ed">
<title level="m">The Chicago Manual of Style</title>,
<edition>15th edition</edition>. <pubPlace>Chicago</pubPlace>:
<publisher>University of
Chicago Press</publisher> (<date>2003</date>),
<biblScope unit="page">p.147</biblScope>.

</bibl>
```

Example

```
<elementRef key="p" source="tei:2.0.1"/>
```

Include in the schema an element named **<p>** available from the TEI P5 2.0.1 release.

Example

```
<schemaSpec ident="myODD"
source="mycompiledODD.xml">
<!-- further declarations specifying the components required -->
</schemaSpec>
```

Create a schema using components taken from the file mycompiledODD.xml.

att.media provides attributes for specifying display and related properties of external media.

Module tei

Members graphic

Attributes Attributes

@width Where the media are displayed, indicates the display width
Status Optional

Datatype teidata.outputMeasurement

@height Where the media are displayed, indicates the display height

Status Optional

Datatype teidata.outputMeasurement

att.naming provides attributes common to elements which refer to named persons, places, organizations etc. [3.5.1. Referring Strings 13.3.5. Names and Nyms]

Module tei

Members att.personal

Attributes Attributes

@role may be used to specify further information about the entity referenced by this name in the form of a set of whitespace-separated values, for example the occupation of a person, or the status of a place.

Status Optional

Datatype 1– ∞ occurrences of teidata.enumerated separated by whitespace

att.placement provides attributes for describing where on the source page or object a textual element appears. [3.4.3. Additions, Deletions, and Omissions 11.3.1.4. Additions and Deletions]

Module tei

Members head

Attributes Attributes

@place specifies where this item is placed.

Status Recommended

Datatype 1– ∞ occurrences of teidata.enumerated separated by whitespace

Suggested values include: **below** below the line

bottom at the foot of the page

margin in the margin (left, right, or both)

top at the top of the page

opposite on the opposite, i.e. facing, page

overleaf on the other side of the leaf

above above the line

end at the end of e.g. chapter or volume.

inline within the body of the text.

inspace in a predefined space, for example left by an earlier scribe.

<add place="margin">[An addition written in the margin]**</add>**

<add place="bottom opposite">[An addition written at the foot of the current page and also on the facing page]**</add>**

<note place="bottom">Ibid, p.7**</note>**

att.pointing provides a set of attributes used by all elements which point to other

elements by means of one or more URI references. [1.3.1.1.2. Language Indicators
3.6. Simple Links and Cross-References]

Module `tei`

Members `catRef` `licence`

Attributes `Attributes`

@target specifies the destination of the reference by supplying one or more URI
References

Status Optional

Datatype 1– ∞ occurrences of `teidata.pointer` separated by whitespace

Note One or more syntactically valid URI references, separated by
whitespace. Because whitespace is used to separate URIs, no
whitespace is permitted inside a single URI. If a whitespace
character is required in a URI, it should be escaped with the normal
mechanism, e.g. `TEI%20Consortium`.

att.resourced provides attributes by which a resource (such as an externally held media
file) may be located.

Module `tei`

Members `graphic`

Attributes `Attributes`

@url (uniform resource locator) specifies the URL from which the media
concerned may be obtained.

Status Required

Datatype `teidata.pointer`

att.tableDecoration provides attributes used to decorate rows or cells of a table.
[14. Tables, Formulæ, Graphics and Notated Music]

Module `tei`

Members `cell` `row`

Attributes `Attributes`

@role indicates the kind of information held in this cell or in each cell of this row.

Status Optional

Datatype `teidata.enumerated`

Legal values are: **data** [Default]

label

Note When this attribute is specified on a row, its value is the default
for all cells in this row. When specified on a cell, its value overrides
any default specified by the *role* attribute of the parent `<row>`
element.

@rows indicates the number of rows occupied by this cell or row.

Status Optional

Datatype `teidata.count`

Default 1

Note A value greater than one indicates that this cell spans several

rows. Where several cells span multiple rows, it may be more convenient to use nested tables.

@cols (columns) indicates the number of columns occupied by this cell or row.

Status Optional

Datatype teidata.count

Default 1

Note A value greater than one indicates that this cell or row spans several columns. Where an initial cell spans an entire row, it may be better treated as a heading.

att.typed provides attributes which can be used to classify or subclassify elements in any way. [1.3.1. Attribute Classes 17.1.1. Words and Above 3.5.1. Referring Strings 3.6. Simple Links and Cross-References 3.5.5. Abbreviations and Their Expansions 3.12.1. Core Tags for Verse 7.2.5. Speech Contents 4.1.1. Un-numbered Divisions 4.1.2. Numbered Divisions 4.2.1. Headings and Trailers 4.4. Virtual Divisions 13.3.2.3. Personal Relationships 11.3.1.1. Core Elements for Transcriptional Work 16.1.1. Pointers and Links 16.3. Blocks, Segments, and Anchors 12.2. Linking the Apparatus to the Text 22.5.2. RELAX NG Content Models 8.3. Elements Unique to Spoken Texts 23.3.1.4. Modification of Attribute and Attribute Value Lists]

Module tei

Members TEI change listChange listPerson table

Attributes Attributes

@type characterizes the element in some sense, using any convenient classification scheme or typology.

Status Optional

Datatype teidata.enumerated

```
<div type="verse">
  <head>Night in Tarras</head>
  <lg type="stanza">
    <l>At evening tramping on the hot white road</l>
    <l>...</l>
  </lg>
  <lg type="stanza">
    <l>A wind sprang up from nowhere as the sky</l>
    <l>...</l>
  </lg>
</div>
```

Note The *type* attribute is present on a number of elements, not all of which are members of att.typed, usually because these elements restrict the possible values for the attribute in a specific way.

Schematron <sch:rule context="tei:*[@subtype]"> <sch:assert test="@type">The <sch:name/> element should not be categorized in detail with @subtype unless also categorized in general with @type</sch:assert> </sch:rule>

Note When appropriate, values from an established typology should be used.

Alternatively a typology may be defined in the associated TEI header. If values are to be taken from a project-specific list, this should be defined using the **<valList>** element in the project-specific schema description, as described in 23.3.1.4.

Modification of Attribute and Attribute Value Lists .

att.written provides an attribute to indicate the hand in which the textual content of an element was written in the source being transcribed. [1.3.1. Attribute Classes]

Module tei

Members div head hi label note p text

Attributes Attributes

@hand points to a **<handNote>** element describing the hand considered responsible for the textual content of the element concerned.

Status Optional

Datatype teidata.pointer

A.4 Macros

macro.limitedContent (paragraph content) defines the content of prose elements that are not used for transcription of extant materials. [1.3. The TEI Class System]

Module tei

Used by desc rendition

Content model

```
<content>
  <alternate minOccurs="0"
    maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.limitedPhrase"/>
    <classRef key="model.inter"/>
  </alternate>
</content>
```

Declaration

```
macro.limitedContent = ( text | model.limitedPhrase | model.inter )*
```

macro.paraContent (paragraph content) defines the content of paragraphs and similar elements. [1.3. The TEI Class System]

Module tei

Used by emph hi p ref supplied title

Content model

```
<content>
  <alternate minOccurs="0"
    maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.global"/>
    <elementRef key="lg"/>
    <classRef key="model.lLike"/>
  </alternate>
</content>
```

Declaration

```
macro.paraContent =  
  (  
    text  
    | model.gLike      | model.phrase      | model.inter      | model.global      | lg      | model
```

macro.phraseSeq (phrase sequence) defines a sequence of character data and phrase-level elements. [1.4.1. Standard Content Models]

Module tei

Used by abbr affiliation author biblScope edition editor eg email foreign forename label mentioned name num orgName pubPlace publisher roleName soCalled surname term

Content model

```
<content>  
  <alternate minOccurs="0"  
    maxOccurs="unbounded">  
    <textNode/>  
    <classRef key="model.gLike"/>  
    <classRef key="model.phrase"/>  
    <classRef key="model.global"/>  
  </alternate>  
</content>
```

Declaration

```
macro.phraseSeq = ( text | model.gLike | model.phrase | model.global )*
```

macro.phraseSeq.limited (limited phrase sequence) defines a sequence of character data and those phrase-level elements that are not typically used for transcribing extant documents. [1.4.1. Standard Content Models]

Module tei

Used by classCode language

Content model

```
<content>  
  <alternate minOccurs="0"  
    maxOccurs="unbounded">  
    <textNode/>  
    <classRef key="model.limitedPhrase"/>  
    <classRef key="model.global"/>  
  </alternate>  
</content>
```

Declaration

```
macro.phraseSeq.limited = ( text | model.limitedPhrase | model.global )*
```

macro.specialPara ('special' paragraph content) defines the content model of elements such as notes or list items, which either contain a series of component-level elements or else have the same structure as a paragraph, containing a series of phrase-level and inter-level elements. [1.3. The TEI Class System]

Module tei

Used by cell change item licence note q quote

Content model

```
<content>
  <alternate minOccurs="0"
    maxOccurs="unbounded">
    <textNode/>
    <classRef key="model.gLike"/>
    <classRef key="model.phrase"/>
    <classRef key="model.inter"/>
    <classRef key="model.divPart"/>
    <classRef key="model.global"/>
  </alternate>
</content>
```

Declaration

```
macro.specialPara =
(
  text
  | model.gLike    | model.phrase    | model.inter    | model.divPart    | model.global
```

A.5 Datatypes

teidata.certainty defines the range of attribute values expressing a degree of certainty.

Module tei

Used by teidata.probCert

Content model

```
<content>
  <valList type="closed">
    <valItem ident="high"/>
    <valItem ident="medium"/>
    <valItem ident="low"/>
    <valItem ident="unknown"/>
  </valList>
</content>
```

Declaration

```
teidata.certainty = "high" | "medium" | "low" | "unknown"
```

Note Certainty may be expressed by one of the predefined symbolic values high, medium, or low. The value unknown should be used in cases where the encoder does not wish to assert an opinion about the matter.

teidata.count defines the range of attribute values used for a non-negative integer value used as a count.

Module tei

Used by Element:

- table/@rows
- table/@cols

Content model

```
<content>  
  <dataRef name="nonNegativeInteger"/>  
</content>
```

Declaration `teidata.count = xsd:nonNegativeInteger`

Note Any positive integer value or zero is permitted

teidata.enumerated defines the range of attribute values expressed as a single XML name taken from a list of documented possibilities.

Module tei

Used by Element:

- abbr/@type
- affiliation/@type
- biblScope/@unit
- div/@type
- editor/@role
- egXML/@valid
- gap/@reason
- gap/@agent
- gi/@scheme
- head/@type
- idno/@type
- list/@rend
- list/@type
- num/@type
- person/@role
- person/@age
- ptr/@type
- ref/@type
- rendition/@scheme
- tag/@type
- tag/@scheme
- title/@type
- title/@level

Content model `<content> <dataRef key="teidata.word"/></content>`

Declaration `teidata.enumerated = teidata.word`

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace. Typically, the list of documented possibilities will be provided (or exemplified) by a value list in the associated attribute specification, expressed with a `<valList>` element.

teidata.language defines the range of attribute values used to identify a particular combination of human language and writing system. [6.1. Language Identification]

Module tei

Used by Element:

- language/@ident

Content model

```
<content>
  <alternate>
    <dataRef name="language"/>
    <valList>
      <valItem ident=""/>
    </valList>
  </alternate>
</content>
```

Declaration `teidata.language = xsd:language | ( " " )`

Note The values for this attribute are language tags as defined in BCP 47. Currently BCP 47 comprises RFC 5646 and RFC 4647; over time, other IETF documents may succeed these as the best current practice.

A language tag, per BCP 47, is assembled from a sequence of components or *subtags* separated by the hyphen character (-, U+002D). The tag is made of the following subtags, in the following order. Every subtag except the first is optional. If present, each occurs only once, except the fourth and fifth components (variant and extension), which are repeatable.

language The IANA-registered code for the language. This is almost always the same as the ISO 639 2-letter language code if there is one. The list of available registered language subtags can be found at <http://www.iana.org/assignments/language-subtag-registry>. It is recommended that this code be written in lower case.

script The ISO 15924 code for the script. These codes consist of 4 letters, and it is recommended they be written with an initial capital, the other three letters in lower case. The canonical list of codes is maintained by the Unicode Consortium, and is available at <http://unicode.org/iso15924/iso15924-codes.html>. The IETF recommends this code be omitted unless it is necessary to make a distinction you need.

region Either an ISO 3166 country code or a UN M.49 region code that is registered with IANA (not all such codes are registered, e.g. UN codes for economic groupings or codes for countries for which there is already an ISO 3166 2-letter code are not registered). The former consist of 2 letters, and it is

recommended they be written in upper case; the list of codes can be searched or browsed at <https://www.iso.org/obp/ui/#search/code/>. The latter consist of 3 digits; the list of codes can be found at <http://unstats.un.org/unsd/methods/m49/m49.htm>.

variant An IANA-registered variation. These codes are used to indicate additional, well-recognized variations that define a language or its dialects that are not covered by other available subtags.

extension An extension has the format of a single letter followed by a hyphen followed by additional subtags. These exist to allow for future extension to BCP 47, but as of this writing no such extensions are in use.

private use An extension that uses the initial subtag of the single letter *x* (i.e., starts with **x-**) has no meaning except as negotiated among the parties involved. These should be used with great care, since they interfere with the interoperability that use of RFC 4646 is intended to promote. In order for a document that makes use of these subtags to be TEI-conformant, a corresponding `<language>` element must be present in the TEI header.

There are two exceptions to the above format. First, there are language tags in the IANA registry that do not match the above syntax, but are present because they have been grandfathered from previous specifications.

Second, an entire language tag can consist of only a private use subtag. These tags start with **x-**, and do not need to follow any further rules established by the IETF and endorsed by these Guidelines. Like all language tags that make use of private use subtags, the language in question must be documented in a corresponding `<language>` element in the TEI header.

Examples include

sn Shona

zh-TW Taiwanese

zh-Hant-HK Chinese written in traditional script as used in Hong Kong

en-SL English as spoken in Sierra Leone

pl Polish

es-MX Spanish as spoken in Mexico

es-419 Spanish as spoken in Latin America

The W3C Internationalization Activity has published a useful introduction to BCP 47, Language tags in HTML and XML.

teidata.name defines the range of attribute values expressed as an XML Name.

Module tei

Used by att giElement:

- application/@ident

Content model

<code><content> <dataRef name="Name"/></content></code>

Declaration

<code>teidata.name = xsd:Name</code>

Note Attributes using this datatype must contain a single word which follows the rules defining a legal XML name (see <http://www.w3.org/TR/REC-xml/#dt-name>): for example they cannot include whitespace or begin with digits.

teidata.namespace defines the range of attribute values used to indicate XML namespaces as defined by the W3C Namespaces in XML Technical Recommendation.

Module tei

Used by

Content model `<content> <dataRef name="anyURI"/></content>`

Declaration `teidata.namespace = xsd:anyURI`

Note The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*

teidata.numeric defines the range of attribute values used for numeric values.

Module tei

Used by Element:

- num/@value

Content model

```
<content>
  <alternate>
    <dataRef name="double"/>
    <dataRef name="token"
      restriction="(\-?[\\d]+/\\-?[\\d]+)"/>
    <dataRef name="decimal"/>
  </alternate>
</content>
```

Declaration

```
teidata.numeric =
  xsd:double | token { pattern = "(\\-?[\\d]+/\\-?[\\d]+)" } | xsd:decimal
```

Note Any numeric value, represented as a decimal number, in floating point format, or as a ratio.

To represent a floating point number, expressed in scientific notation, E notation, a variant of exponential notation, may be used. In this format, the value is expressed as two numbers separated by the letter E. The first number, the significand (sometimes called the mantissa) is given in decimal format, while the second is an integer. The value is obtained by multiplying the mantissa by 10 the number of times indicated by the integer. Thus the value represented in decimal notation as 1000.0 might be represented in scientific notation as 10E3.

A value expressed as a ratio is represented by two integer values separated by a solidus (/) character. Thus, the value represented in decimal notation as 0.5 might be represented as a ratio by the string 1/2.

teidata.outputMeasurement defines a range of values for use in specifying the size of an object that is intended for display.

Module tei

Used by

Content model

```
<content>
  <dataRef name="token"
    restriction="[\-+]?d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm)"/>
</content>
```

Declaration

```
teidata.outputMeasurement =
  token
  {
    pattern = "[\-+]?d+(\.\d+)?(%|cm|mm|in|pt|pc|px|em|ex|gd|rem|vw|vh|vm) "
```

Example

```
<figure>
  <head>The TEI Logo</head>
  <figDesc>Stylized yellow angle brackets with the letters
<mentioned>TEI</mentioned> in
  between and <mentioned>text encoding initiative</mentioned> underneath,
all on a white
  background.</figDesc>
  <graphic height="600px" width="600px"
    url="http://www.tei-c.org/logos/TEI-600.jpg"/>
</figure>
```

Note These values map directly onto the values used by XSL-FO and CSS. For definitions of the units see those specifications; at the time of this writing the most complete list is in the CSS3 working draft.

teidata.pointer defines the range of attribute values used to provide a single URI, absolute or relative, pointing to some other resource, either within the current document or elsewhere.

Module tei

Used by Element:

- catRef/@scheme
- change/@target
- classCode/@scheme
- gap/@hand
- keywords/@scheme
- ptr/@target
- ref/@target

Content model `<content> <dataRef name="anyURI"/></content>`

Declaration `teidata.pointer = xsd:anyURI`

Note The range of syntactically valid values is defined by RFC 3986 *Uniform Resource Identifier (URI): Generic Syntax*. Note that the values themselves are encoded using RFC 3987 *Internationalized Resource Identifiers (IRIs) mapping to URIs*. For example, <https://secure.wikimedia.org/wikipedia/en/wiki/%> is

encoded as <https://secure.wikimedia.org/wikipedia/en/wiki/%25>
 while <http://موقع.وزارة-الاتصالات.مصر/> is encoded as
<http://xn--4gbrim.xn---rmckbbajlc6dj7bxne2c.xn--wgbh1c/>

teidata.probCert defines a range of attribute values which can be expressed either as a numeric probability or as a coded certainty value.

Module tei

Used by

Content model

```
<content>
  <alternate>
    <dataRef key="teidata.probability"/>
    <dataRef key="teidata.certainty"/>
  </alternate>
</content>
```

Declaration

```
teidata.probCert = teidata.probability | teidata.certainty
```

teidata.probability defines the range of attribute values expressing a probability.

Module tei

Used by teidata.probCert

Content model `<content> <dataRef name="double"/></content>`

Declaration `teidata.probability = xsd:double`

Note Probability is expressed as a real number between 0 and 1; 0 representing *certainly false* and 1 representing *certainly true*.

teidata.sex defines the range of attribute values used to identify human or animal sex.

Module tei

Used by Element:

- person/@sex

Content model `<content> <dataRef key="teidata.word"/></content>`

Declaration `teidata.sex = teidata.word`

Note Values for attributes using this datatype may be locally defined by a project, or may refer to an external standard, such as vCard's sex property <http://microformats.org/wiki/gender-formats> (in which M indicates male, F female, O other, N none or not applicable, U unknown), or the often used ISO 5218:2004 *Representation of Human Sexes* [http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004\(E_F\).zip](http://standards.iso.org/ittf/PubliclyAvailableStandards/c036266_ISO_IEC_5218_2004(E_F).zip) (in which 0 indicates unknown; 1 male; 2 female; and 9 not applicable, although the ISO standard is widely considered inadequate); cf. CETH's *Recommendations for Inclusive Data Collection of Trans*

People

<http://transhealth.ucsf.edu/trans?page=lib-data-collection>.

teidata.temporal.w3c defines the range of attribute values expressing a temporal expression such as a date, a time, or a combination of them, that conform to the W3C *XML Schema Part 2: Datatypes Second Edition* specification.

Module tei

Used by

Content model

```
<content>
  <alternate>
    <dataRef name="date"/>
    <dataRef name="gYear"/>
    <dataRef name="gMonth"/>
    <dataRef name="gDay"/>
    <dataRef name="gYearMonth"/>
    <dataRef name="gMonthDay"/>
    <dataRef name="time"/>
    <dataRef name="dateTime"/>
  </alternate>
</content>
```

Declaration

```
teidata.temporal.w3c =
  xsd:date
| xsd:gYear
| xsd:gMonth
| xsd:gDay
| xsd:gYearMonth
| xsd:gMonthDay
| xsd:time
| xsd:dateTime
```

Note If it is likely that the value used is to be compared with another, then a time zone indicator should always be included, and only the dateTime representation should be used.

teidata.text defines the range of attribute values used to express some kind of identifying string as a single sequence of unicode characters possibly including whitespace.

Module tei

Used by Element:

- rendition/@selector

Content model `<content> <dataRef name="string"/></content>`

Declaration `teidata.text = string`

Note Attributes using this datatype must contain a single token in which whitespace and other punctuation characters are permitted.

teidata.truthValue defines the range of attribute values used to express a truth value.

Module tei

Used by Element:

- listChange/@ordered
- tagsDecl/@partial

Content model `<content> <dataRef name="boolean"/></content>`

Declaration `teidata.truthValue = xsd:boolean`

Note The possible values of this datatype are 1 or true, or 0 or false.

This datatype applies only for cases where uncertainty is inappropriate; if the attribute concerned may have a value other than true or false, e.g. unknown, or inapplicable, it should have the extended version of this datatype: `data.xTruthValue`.

teidata.versionNumber defines the range of attribute values used for version numbers.

Module tei

Used by Element:

- application/@version

Content model

```
<content>
  <dataRef name="token"
    restriction="\d+[a-z]*\d*(\.\d+[a-z]*\d*){0,3}" />
</content>
```

Declaration

```
teidata.versionNumber =
  token { pattern = "\d+[a-z]*\d*(\.\d+[a-z]*\d*){0,3}" }
```

teidata.word defines the range of attribute values expressed as a single word or token.

Module tei

Used by teidata.enumerated teidata.sexElement:

- code/@lang
- supplied/@reason

Content model

```
<content>
  <dataRef name="token"
    restriction="(\p{L}|\p{N}|\p{P}|\p{S})+" />
</content>
```

Declaration

```
teidata.word = token { pattern = "(\p{L}|\p{N}|\p{P}|\p{S})+" }
```

Note Attributes using this datatype must contain a single word which contains only letters, digits, punctuation characters, or symbols: thus it cannot include whitespace.

A.6 Constraints

Schematron

```
<sch:rule context="text()[not(ancestor::tei:eg|ancestor::eg:egXML|ancestor::tei:code|ancestor::tei:tag)][">
$apos.typographic)]"> <sch:report test="matches(., '\W[\D]' or matches(.,
